Abstract. In this article the volume of the $n$-dimensional ellipsoid is derived using the method, step by step process of integration. Recurrence relations are developed to find the volume and surface area of $n$-dimensional sphere. The relation between the volume and surface area of $n$-dimensional sphere is given. The asymptotic behavior of the volume and surface area of the unit sphere is also discussed.

Key words: $n$-dimensional ellipsoid, volume, surface area, asymptotic behavior, Euclidean space.

(Received: 13 December 2009)

1 Introduction

Let $\mathbb{R}^n$ be the $n$-dimensional Euclidean space. The equation to the $n$-dimensional ellipsoid is given by $\sum_{i=1}^{n} \frac{x_i^2}{a_i^2} = 1$ where $a_i$ denotes the length of the semi axes of the ellipsoid. The ellipsoid axes are aligned with the Cartesian coordinate axes of the $n$-dimensional Euclidean space. A method to determine the volume of of the ellipsoid is being proposed in this article. This method is based on a step by step process in which the dimension is reduced by one in each step.
2 Evaluation of volume

**Theorem 2.1.** The volume of the n-dimensional ellipsoid is given by

\[ V_n = \frac{2 \pi^{n/2}}{n \Gamma(n/2)} (a_1, a_2, a_3 \ldots a_n) \]

where \( a_1, a_2, a_3 \ldots a_n \), denote the length of semi axes of the n-dimensional ellipsoid.

**Proof.** Let \( V_n \) be the volume of the n-dimensional ellipsoid \( \sum_{i=1}^{n} \frac{x_i^2}{a_i^2} = 1 \).

\( V_1 \) is the volume for \( \frac{x_1^2}{a_1^2} = 1 \), denoting the length of the segment from \(-a_1\) to \(+a_1\) which is equal to \( 2a_1 \).

\( V_2 \) is the area of the ellipse \( \frac{x_1^2}{a_1^2} + \frac{x_2^2}{a_2^2} = 1 \).

\[ V_2 = \pi a_1 a_2 = a_1 a_2 2 \beta \left( \frac{3}{2}, \frac{1}{2} \right) \]

\( V_3 \) is the volume of the three dimensional ellipsoid \( \frac{x_1^2}{a_1^2} + \frac{x_2^2}{a_2^2} + \frac{x_3^2}{a_3^2} = 1 \). We can write it as

\[ \left( \frac{a_1}{a_3} \right)^2 \left( a_3^2 - x_3^2 \right) + \left( \frac{a_2}{a_3} \right)^2 \left( a_3^2 - x_3^2 \right) = 1. \]

It is an ellipse with varying semi axes \( \frac{a_1}{a_3} \sqrt{a_3^2 - x_3^2} \) and \( \frac{a_2}{a_3} \sqrt{a_3^2 - x_3^2} \) ranging from \(-a_3\) to \( a_3 \). The required volume is the collection of elliptic plates arranged one above the other. Hence

\[ V_3 = \pi \frac{a_1 a_2}{a_3} \int_{-a_3}^{a_3} (a_3^2 - x_3^2) dx_3 \]

\[ = \pi \frac{a_1 a_2}{a_3} 2a_3 \int_0^{\frac{\pi}{2}} \cos^3 \theta d\theta, \quad \text{under the substitution } x_3 = a_3 \sin \theta \]

\[ = a_1 a_2 a_3 2 \beta \left( \frac{3}{2}, \frac{1}{2} \right) \beta \left( 2, \frac{1}{2} \right) \]
$V_4$ is the volume of the fourth dimensional ellipsoid

$$\frac{x_1^2}{a_1^2} + \frac{x_2^2}{a_2^2} + \frac{x_3^2}{a_3^2} + \frac{x_4^2}{a_4^2} = 1$$

which can be written as

$$\frac{x_1^2}{(\frac{a_1}{a_4})^2 (a_4^2 - x_4^2)} + \frac{x_2^2}{(\frac{a_2}{a_4})^2 (a_4^2 - x_4^2)} + \frac{x_3^2}{(\frac{a_3}{a_4})^2 (a_4^2 - x_4^2)} = 1$$

It’s volume is

$$V_4 = \frac{a_1 a_2 a_3}{a_4 a_4 a_4} 2 \beta \left(\frac{3}{2}, \frac{1}{2}\right) \beta \left(2, \frac{1}{2}\right) \int_{-a_4}^{a_4} (a_4^2 - x_4^2)^{\frac{3}{2}} dx_4$$

$$= a_1 a_2 a_3 a_4 2 \beta \left(\frac{3}{2}, \frac{1}{2}\right) \beta \left(2, \frac{1}{2}\right) \beta \left(\frac{5}{2}, \frac{1}{2}\right)$$

Generalizing this

$$V_n = a_1 a_2 a_3 \cdots a_n 2 \beta \left(\frac{3}{2}, \frac{1}{2}\right) \beta \left(2, \frac{1}{2}\right) \beta \left(\frac{5}{2}, \frac{1}{2}\right) \cdots \beta \left(\frac{n}{2}, \frac{1}{2}\right)$$

$$= (a_1 a_2 a_3 \cdots a_n) \frac{2 \pi^{\frac{n}{2}}}{n \cdot \Gamma(n/2)}$$ (on simplification)

### 3 Special cases

The volume of the $n$-dimensional sphere is

$$V_n = \frac{2 \pi^n}{n \cdot \Gamma(n/2)} a^n,$$ where $a$ is the radius of the sphere. (1)

The recurrence formula for the volume of the $n$-dimensional sphere is given by

$$V_{n+2} = \frac{2\pi a^2}{n+2} V_n \quad \text{with} \quad V_0 = 1, V_1 = 2a$$

The concept of volume is meaningful for $n \geq 3$, for $n = 2$ it coincides with the common concept of area of a circle and for $n = 1$ with the length of a one dimensional interval
and for \( n = 0 \), corresponds to a zero-dimensional sphere of volume \( V = 1 \). On differentiating the volume with respect to the radius we get the surface area. Hence the surface area is

\[
S_n = \frac{dV_n}{da} = \frac{2a^{n-1}\pi^{\frac{n}{2}}}{\Gamma(n/2)}.
\]

The recurrence formula for the surface area of the sphere is given by

\[
S_{n+2} = \frac{2\pi a^2}{n}S_n, \quad n \neq 0 \quad \text{with} \quad S_0 = 0 \quad \text{and} \quad S_1 = 2.
\]

From (1) and (2), the volume and the surface area of \( n \)-dimensional sphere are related by

\[
V_n = \frac{a}{n}S_n
\]

The volume and surface area of the unit sphere is given by

\[
V_n = \frac{2\pi^n}{n\Gamma(n/2)} \quad \text{and} \quad S_n = \frac{2\pi^n}{\Gamma(n/2)}
\]

4 Asymptotic behavior

Using the recurrence relations the volume and surface area of the unit sphere for different dimensions are given in Table [1] and are illustrated in Figs. [1] and [2].

It is clear that the volume reaches a maximum for \( n = 5 \) and the surface area reaches a maximum for \( n = 7 \) and decays to zero as the dimension increases.

5 Conclusion

From the general formula we can find the volume and surface area for any dimension. The volume and surface area for different dimensions are graphically presented. As the dimension is large both volume and surface area asymptotically tends to zero, is an interesting phenomenon.
Figure 1: Asymptotic behaviour of volume.

Figure 2: Asymptotic behaviour of surface area.
