ABSTRACT
In this paper parameters of the micro strip patch antenna (MSA) which is feed by co–axial feed technique is enhanced by using the DGS technique, and comparing the results of different DGS shapes with the original MSA antenna using the HFSS (High Frequency Structure Simulator), which is a commercially available electromagnetic simulator based on finite element method and adaptive meshing technique to achieve the desired specification.

Keywords-HFSS, DGS, MSA and Co-axial feed

1. INTRODUCTION
A Micro strip Patch antenna consists of a radiating patch on one side of a dielectric substrate which has a ground plane on the other side as shown in Figure 1. The patch is generally made of conducting material such as copper or gold. The radiating patch and the feed lines are usually photo etched on the dielectric substrate. Micro strip patch antennas radiate primarily because of the fringing fields between the patch edge and the ground plane. Micro strip antennas are characterized by a larger number of physical parameters than conventional microwave antennas. They can be designed to have many geometrical shapes and dimensions but rectangular and circular Micro strip resonant patches have been used extensively in many applications. In this paper, the design of probe feed rectangular micro strip antenna is for satellite applications is presented and is expected to operate within 2GHz - 2.5GHz frequency span. This antenna is designed on a double sided Fibre Reinforced (FR-4) epoxy and its performance characteristics which include Return Loss, VSWR, and input impedance are obtained from the simulation results, these parameters of the MSA is enhanced using the DGS technique in this paper.

1.1 Overview of DGS technique
DGS is an etched periodic or non-periodic cascaded configuration defect in ground of a planar transmission line (e.g., micro strip, coplanar and conductor backed coplanar wave guide) which disturbs the shield current distribution in the ground plane cause of the defect in the ground. This disturbance will change characteristics of a transmission line such as line capacitance and inductance. In a word, any defect etched in the ground plane of the micro strip can give rise to increasing effective capacitance and inductance. There are many shapes of DGS available but in this paper we are using Dumbbell shape shown in figure 2.

1.2 ANTENNA DESIGN
Figure 3(a) and 3(b) shows the geometry of proposed coaxial fed micro strip patch antennas with single band operation for WLAN application. The antenna is excited by coaxial feed line designed for a 50 ohm characteristic impedance and is printed on substrate with a thickness of 1.6mm, relative permittivity 4.4 and loss tangent of 0.0009. The dimensions of the proposed antenna are written below:

<table>
<thead>

</tbody>
</table>

Table 1 Dimensions of the Patch Antenna Design for 2.25 GHz frequency

The proposed antenna is fed by coaxial cable with a characteristic impedance of 50 ohm. So, the outer conductor (from bottom of ground to top of ground) is made of substrate material and inner conductor (from bottom of ground to top of patch) is made of PEC material. The feed point for the proposed antenna is found to be (30.9, 16.66) where the best impedance matching of 46.48 ohm has been achieved which is very much close to 50 ohm. This has been done by applying parametric sweep for locating the feed point in the full range of x-axis in the window of transient solver. Proper impedance matching always yields the best desired result. Location of the DGS shapes and dimensions are explained in the below table for the proposed antenna design.

2. SIMULATIONS AND RESULTS

The simulation results of the above designed antenna of various parameters like return loss, impedance, directivity and VSWR are given by using HFSS.

The above designed antenna shows good return loss approximately -24dB which is an excellent result. This antenna resonates at 2.25 GHz frequencies which is applicable for Wireless Local Area Network (WLAN standards - 2.2-2.483 GHz for IEEE 802.11 b/g) applications and gives a bandwidth of approximately 90 MHz. The bandwidth is calculated by subtracting lower frequency from the upper frequency at -10dB. The proposed antenna design gives good impedance of approximately 45 ohms which shows that the antenna is perfectly matched and the power loss is minimum. The result of the designed antenna is given below.
The designed antenna shows the VSWR of 1.1421 at 2.25 GHz frequency

The results of the above designed antenna are summarized in the following table.

Table 3 Summary of Parameter Values of Designed Antenna at 2.25 GHz frequency

2.1 Simulation Result for dumbbell shape
The above designed antenna gives return loss of -28.13dB and bandwidth 90MHz of at 2.25GHz. The simulated results of the proposed antenna are given below
The designed antenna gives an impedance of around 47 ohms which is nearby 50 ohms so it is acceptable. The simulated result of impedance is given below.

Figure 8  Simulated impedance of MSA Resonating at 2.25 GHz with dumbbell DGS

The simulated antenna gives VSWR of 1.08 at 2.25GHz. The simulation results of VSWR at 2.25 resonating frequency are given as follows.

Figure 9  Simulated VSWR of MSA Resonating at 2.25 GHz with dumbbell DGS

The results of the above designed antenna are summarized in the following table

3. CONCLUSION
In this paper, we presented the design of a rectangular patch antenna covering the 2GHz–2.5 GHz frequency spectrum. It has been shown that this design of the rectangular patch antenna produces a bandwidth of approximately 4% with a stable radiation pattern within the frequency range. The design antenna exhibits a good impedance matching of approximately 50 Ohms at the centre frequency. The parameters of the antenna is enhanced by the DGS technique used above, a comparison table between the MSA antenna and the antenna with DGS is shown below which conclude that DGS improves the Overall efficiency of the MSA.

Table 5 Comparision of Parameter Values of different Antennas at 2.25 GHz frequency

The table above shows that the antenna is acceptable, for various applications. The return loss, VSWR is minimum in dumbbell shape DGS technique and higher line impedance compare to other antenna which is very good for the communication.
