Abstract:
A simple, precise, accurate, and economical UV visible spectrophotometric method has been developed for estimation of Cefadroxil drug by AUC method. The standard and sample solutions were prepared by using double distilled water as a solvent. Quantitative determination of the drug was performed at wavelength range 260-266 nm. The linearity was established over the concentration range of 0.5-25 µg/ml for Cefadroxil with correlation coefficient value of 0.9993. Precision studies showed that % relative standard deviation was within range of acceptable limits. The mean percentage recovery was found to be 99.26%. The proposed method has been validated as per ICH guidelines.

Keywords: Cefadroxil, UV visible spectrophotometry, AUC, Method Validation.

INTRODUCTION
Cefadroxil (CFD) is chemically, \((7R)-7-(\alpha-D-4-
Hydroxyphenylglycylamino)-3-methyl-3-cephem-4-
carboxylic acid\) [1]. Cefadroxil is a first-generation
cephalosporin antibacterial that is para-hydroxy
derivative pf cephalexin and is used similarly in the
treatment of mild to moderate susceptible infections
[2]. Cefadroxil is official in IP, USP and BP. IP [3],
method for the estimation of cefadroxil. Literature
survey revealed several analytical methods
chemiluminescence [6], Spectrophotometric [7-10] and
HPLC [11-14] have been reported in bulk,
pharmaceutical dosage form for determination of
Cefadroxil. Hence an attempt has been made to develop
new UV-Spectrophotometric (AUC) method for
estimation of Cefadroxil in bulk and pharmaceutical
formulations with good accuracy simplicity, precision
and economy.

Fig. 1: Chemical structure of Cefadroxil.

MATERIALS AND METHODS
Apparatus and Instrumentation
A Shimadzu 1800 UV/VIS double beam
spectrophotometer with 1cm matched quartz cells was
used for all spectral measurements. Single Pan
Electronic balance (CONTECH, CA 223, India) was
used for weighing purpose. Sonication of the solutions
was carried out using an Ultrasonic Cleaning Bath
(Spectra lab UCB 40, India). Calibrated volumetric
glassware (Borosil®) was used for the validation study.

Materials
Reference standard of Cefadroxil API was supplied as
gift sample by Lupin Laboratory park, Aurangabad.
Tablet sample with label claim 250 mg per tablet were
purchased from local market Pune.

Method development
Determination of Wavelength Range
For the selection of analytical wavelength range for
area under curve method, 20µg/ml solution of
Cefadroxil was scanned in the spectrum mode from
400 nm to 200 nm against distilled water as blank.
Wavelength range was selected around wavelength
maxima (264nm). Different working standards
were prepared between 05-25 µg/ml. Various
wavelength range were tried and final wavelength range between
260-266 nm was selected on the basis of linear
relationship between area and corresponding
centration (Figure 2).

![UV AUC Spectrum of Cefadroxil (20µg/ml)](image)

Fig 2: UV AUC Spectrum of Cefadroxil (20µg/ml)

Area under Curve (Area calculation)
Area under curve method involves the calculation of
integrated value of absorbance with respect to the
wavelength between two selected wavelengths such as
\(\lambda_1\) and \(\lambda_2\) representing start and end point of curve
region. The area under curve between \(\lambda_1\) and \(\lambda_2\) was
calculated using UV probe software. In this study area
was integrated between wavelength ranges from 260 to
266 nm.

Area calculation: \((\alpha + \beta) = \int_{\lambda_2}^{\lambda_1} \text{Ad} \lambda\)

Where, \(\alpha\) is area of portion bounded by curve data and
a straight line connecting the start and end point, \(\beta\) is
the area of portion bounded by a straight line
connecting the start and end point on curve data and
horizontal axis, \(\lambda_1\) and \(\lambda_2\) are wavelength range start
and end point of curve region [14].
Preparation of Standard Solution
The standard stock solution of Cefadroxil was prepared by accurately weighing & transferring, 10 mg of API to 100 ml of volumetric flask. The drug was dissolved with sonication in 50 ml of distilled water and volume was made up to the mark by using distilled water. Then take from that 2ml and add to 10ml volumetric flask and make up with distilled water to get final standard stock solution (20µg/ml) was further diluted with distilled water to obtain 05-25 µg/ml Cefadroxil solutions.

Calibration Curve for Cefadroxil
The dilutions were made from Standard Stock solution to get concentration of 05, 10, 15, 20, and 25 µg/ml respectively. These solutions were scanned from 400 to 200 nm and area under curve (AUC) values was integrated in the range of 260-266 nm. The calibration curve was plotted between areas under curve values against concentration (Fig. 3).

Assay of Tablet Formulation
Twenty tablets each containing 250 mg of Cefadroxil were weighed crushed to powder and average weight was calculated. Powder equivalent to 10 mg of Cefadroxil was transferred in 100 ml of volumetric flask. A 50 ml of distilled water was added and sonicated for 15 minutes. Then solution was further diluted up to the mark with distilled water. The solution was filtered using Whatmann filter paper no. 41; first 5 ml of filtrate was discarded. This solution was further diluted to obtain 15µg/mL solution with water, subjected for UV analysis using distilled water as blank. This procedure was repeated three times shown in Table 1.

**Method Validation**

The above method was validated for various parameters such as Accuracy, Linearity, Precision, Limit of detection (LOD) and Limit of Quantitation (LOQ) according to ICH guideline.

**Accuracy**

The accuracy for the analytical method was evaluated at 80%, 100% and 120% levels of 20µg/ml standard solution. Area under curve (AUC) was measured in wavelength range 226-240 nm and results were obtained in terms of percent recovery. Three determinations at each level were performed and % RSD was calculated for each level results were shown in table 2.

**Precision**

The precision of an analytical procedure expresses the closeness of an agreement (degree of scatter) between a series of measurements obtained from multiple sampling of the same homogeneous sample under the prescribed conditions intraday precision was studied by integrating area of standard solution of 20µg/ml concentration at six independent series in the same day. Inter-day precision studies were performed by integrating area of standard solution of 20µg/ml concentration on three consequent days. The %RSD was calculated and results were shown in table 3.

**Linearity and Range**

The linearity was determined by using working standard solutions between 05-25 µg/ml. The areas under curve (AUC) of these solutions were recorded. Calibration curve of area under curve to concentration plotted on excel sheet and linear regression was performed. The correlation coefficient, regression Equation was calculated results were shown in Fig. 3.

**Limit of Detection and Limit of Quantification**

The Limit of Detection (LOD) is the smallest concentration of the analyte that gives the measurable response. LOD was calculated using the following formula

$$\text{LOD} = 3.3 \frac{\sigma}{S}$$

The Limit of Quantification (LOQ) is the smallest concentration of the analyte, which gives response that can be accurately quantified. LOQ was calculated using the following formula

$$\text{LOQ} = 10 \frac{\sigma}{S}$$

Where, $\sigma$ is standard deviation of the response and $S$ is the slope of the calibration curve.

LOD & LOQ of Cefadroxil was found to be 1.04µg/ml & 3.15µg/ml respectively.

Five sets of known concentrations (05-25µg/ml) were prepared and scanned. By using these spectras, regression equations were obtained. By taking average of slopes and standard deviation of y-intercept, LOD and LOQ were calculated. The values of LOD and LOQ are given in table 4.
RESULTS AND DISCUSSION

The UV visible spectroscopic method for the Cefadroxil by area under curve was found to be simple, accurate, economical and reproducible. The drug concentrations were found to be linear in the range of 0.5-25 µg/ml and the correlation coefficient value of 0.9993 indicates that developed method was linear. For Precision the percent relative standard deviation (% RSD) was found to be 0.9734 while, intra-day and inter-day precision results in terms of percent relative standard deviation values were found to be 0.9734 and 0.5142 respectively thus the method is observed as precise. The accuracy of the method was assessed by recovery studies at three different levels i.e. 80%, 100%, 120%. The values of standard deviation were satisfactory and the recovery studies were close to 100%. The % RSD value is ≤ 2 indicates the accuracy of the method. The Limit of Detection and Limit of Quantitation values were found to be 1.04 µg/ml & 3.15 µg/ml respectively. The result of the analysis for pharmaceutical formulation by the developed method was consistent with the label claim, highly reproducible and reliable. The validation parameters are summarized in Table 4. The method can be used for routine quality control analysis of Cefadroxil in bulk and pharmaceutical formulations.

CONCLUSION

The UV spectroscopic AUC method for the analysis of Cefadroxil was found to be simple, precise, and accurate; can be used for assay of bulk drug and pharmaceutical dosage formulations.
