Abstract In this paper, we explore the notion of generalized semi topological groups. This notion is based upon
the two ideas, generalized topological spaces introduced by Csaszar [2,3] and the semi open sets introduced by
Levine [7]. We investigate on the notion of generalized topological group introduced by Hussain [4]. We explore the
idea of Hussain by considering the generalized semi continuity upon the two maps of binary relation and inverse
function.

Keywords: generalized semi open sets, generalized compact sets, generalized continuity, generalized continuity,
generalized discrete sets

1. Introduction

Let \( G \) denotes the generalized topological space \((X, G)\). In accordance with [3], let \( A \subseteq X \) be generalized semi open
if and only if there exists a generalized open set \((G\)-open set\) \( O \subseteq G \) such that \( O \subseteq A \subseteq cl_G(O) \), where \( cl_G(O) \)
denotes the generalized closure of the set \( O \) in \( G \). For more
details on generalized topological spaces, we refer to [2,3].

In 2013, Murad et al. [4], defined and studied the concept of
generalized topological groups \((G\)-topological groups\). This study was further extended and published in [5] and
[6]. In 2015, C. Selvi and R. Selvi [10] were motivated by
\( G\)-topological groups and \( S\)-topological groups [9], and
developed new notion with the name of generalized S-
topological groups.

In this paper, we intend to generalize further the notion of \( G\)-topological groups and \( G\)-S-topological groups by using \( G\)-semi continuity. \( G\)-semi continuity is a
generalization of \( G\)-continuity and it was defined by A. Csapzár in [3].

2. Generalized Semi Topological Group

In this section, we will explore the notion of
generalized semi topological group. Generalized semi
topological groups contains the structure of generalized topology and groups. The whole idea is backed by the
generalized semi continuity, as the binary operation and
the inverse map undergo the process of generalized semi
continuity. We will study the basic definitions and gradual
development of the phenomenon.

Lemma 2.1. Let \((X, \mu_1)\) and \((Y, \mu_2)\) be generalized topological spaces and \( f : X \rightarrow Y \) is generalized semi continuous, then for any subset \( A \) of \( X \), \( f(scl(A)) \subseteq cl(f(A)) \).

Theorem 2.2. Let \((T_1, \mu_1)\) and \((T_2, \mu_2)\) be generalized topological spaces and let \((T_1 \times T_2, \mu_1 \times \mu_2) = (T, \mu)\) be
their product generalized topological space if \( A_1 \) is
generalized semi open set in \( T_1 \) and \( A_2 \) is generalized semi
open in \( T_2 \), then \( A_1 \times A_2 \) is generalized semi open in \( (T, \mu) \).

Proof. Assume that \( A_i = O_i \cup B_i \), where \( O_i \) is
generalized open in \( X_i \) and \( B_i \subseteq cl(O_i) \), for \( i = 1, 2 \).
This is nowhere dense set as well. Then,
\[
A_1 \times A_2 = (O_1 \cup B_1) \times (O_2 \cup B_2) = (O_1 \times O_2) \cup (B_1 \times O_2) \cup (O_1 \times B_2) \cup (B_1 \times B_2)
\]
But \( O_1 \times O_2 \) is generalized open set in \( X_1 \times X_2 \) and
\[
(B_1 \times O_2) \cup (O_1 \times B_2) \cup (B_1 \times B_2) \subseteq cl \mu_1 \times \mu_2 (O_1 \times O_2)
\]
Hence,
\[
A_1 \times A_2 \subseteq A_1 \times A_2 \subseteq cl \mu_1 \times \mu_2 (O_1 \times O_2)
\]
This proves that \( A_1 \times A_2 \) is generalized semi open set in \( X_1 \times X_2 \).

Theorem 2.3. Let \((X, \mu) \rightarrow (Y, \sigma)\) semi generalized continuous map between two generalized topological
spaces. Let \( B \) be semi generalized compact set relative to
\((X, \mu)\) then \( f(B) \) is semi generalized compact in \((Y, \sigma)\).

Proof. Let \( \{U_i : i \in \mathcal{P}\} \) be any collection of generalized
open set of \((X, \mu)\), such that \( f(B) \subseteq \bigcup \{U_i : i \in \mathcal{P}\} \). Then
\( B \subseteq \bigcup \{f^{-1}(U_i) : i \in \mathcal{P}\} \) holds by hypothesis and there
exists a finite subset of \( \mathcal{P}_0 \) of \( \mathcal{P} \) such that \( B \subseteq \bigcup \{f^{-1}(U_i) : i \in \mathcal{P}_0\} \) which shows that \( f(B) \) is semi generalized compact in \((Y, \sigma)\).

3. Semi Generalized Topological Group
In this section, we will define semi generalized topological groups (G -topological groups) and investigate its basic properties.

**Definition 3.1.** (X, , G) is said to be a G - topological group if

1. (X, G) is generalized topological space;
2. (X, ) is a group;
3. The multiplication map m: X × X → X, defined by m(x, y) = x * y and the inverse map i: X → X defined by i(x) = x⁻¹, \(\forall x \in X\) are the generalized semi-continuous.

Equivalently, (X, , G) is semi generalized topological group if \(\forall x, y \in X\) and for each generalized open set W containing \(x * y^{-1} \in X\), there exist generalized semi open sets U containing x and V containing y, such that, \(U * V^{-1} \subseteq W\). Since every G - continuous is semi -continuous -continuous therefore, every G-topological group is G-S-topological groups. And G-S-topological group may not be a G-topological group. Further, we note that, every G-topological group is G-S-topological group and every G-s-topological group is G-S-topological group. However, converses may not be true in general. It is evident from the following example:

**Example 3.2.** Let \(\Gamma = \mathbb{Z}_2 = \{0, 1\}\) be the two-element (cyclic) group with the multiplication mapping \(\mu = +2\) the usual addition modulo 2. Equip \(\Gamma\) with the Sierpinski topology \(\tau = \{\varnothing, \{0\}, \{1\}, \{0, 1\}\}\). Then the collection of all the semi open sets

\[
(\tau \times \tau) = \left\{(0, 0), (0, 0), (0, 1), (0, 1), (1, 0), (1, 0), (1, 1), (1, 1)\right\}
\]

and that \(\mu: \tau \times \tau \to \tau\) is continuous at \((0, 0), (1, 0), (0, 1), (1, 1)\), but not continuous at \((1, 1)\). However, \(\mu\) is semi-continuous at \((1, 1)\). For this, let us take the open set \(\zeta = \{0\}\) in \(\Gamma\) containing \(\mu(1, 1) = 0\). Then the semi-open set \(Y = \{0, 0, (1, 1)\} \in \tau \times \tau\) contains \((1, 1)\). The inverse mapping \(i: \tau \to \tau\) is continuous and hence semi-continuous. Therefore, \((\Gamma, +2, \tau)\) is a G-s-topological group which is not a topological group. It was noticed in [1] that \((\Gamma, +2, \tau)\) is not a G-S-topological group.

**Theorem 3.3.** Let \((X, , \mu)\) be a generalized s-topological group. Let \(i: (X, \mu) \to (X, \mu)\) be an inverse mapping defined by \(i(x) = x^{-1}\). Then \(i\) is generalized semi continuous mapping.

**Proof.** Let \(x \in X\). Let W be a generalized open set in X containing \(x^{-1}\). Then by hypothesis, there exist generalized semi open sets U and V containing e and x, respectively, such that \(U * V^{-1} \subseteq W\). In particular, \(i(V) = V^{-1} = e * V^{-1} \subseteq U * V^{-1} \subseteq W\).

**Theorem 3.4.** If K is semi generalized compact, then \(y * K^{-1}\) is semi generalized compact in a semi generalized topological group \((X, , \mu)\).

**Proof.** Let \(\{U_a: a \in A\}\) be a cover of \(y * K^{-1} \subseteq \bigcup_{a \in A} U_a\). This implies that \(K^{-1} \subseteq y^{-1} * \bigcup_{a \in A} U_a = \bigcup_{a \in A} y^{-1} * U_a\). This implies that \(K \subseteq \bigcup_{a \in A} y * U_a^{-1}\).

Since K is semi generalized compact, then there exists a finite set \(I_0\) of I such that \(y^{-1} * K \subseteq \bigcup_{a \in I_0} U_a^{-1}\). This implies that \(y * K^{-1} \subseteq \bigcup_{a \in \mathcal{C}_0} U_a\). That is \(y * K^{-1}\) has a finite subcover of X. Hence \(y * K^{-1}\) is semi generalized compact.

**Theorem 3.5.** A non empty subgroup H of a semi generalized topological group is semi open if and only if its semi interior is non empty.

**Proof.** Assume that \(x \in S_x \setminus \text{int}(H)\) (semi generalized interior). Then by definition there is a semi generalized open set V such that \(x \in V \subset H\). For every \(y \in H\), we have \(y \in V \subset y \in H\). Since V is semi generalized open so is \(y * V\), we conclude that \(H = \bigcup(y * V: y \in H)\) is a semi generalized open set as the union of semi generalized open sets is semi generalized open. Converse of this theorem is quite simple.

**Lemma 3.6.** Let \((X, \mu_1)\) and \((Y, \mu_2)\) be generalized topological spaces and \(f: X \to Y\) is generalized semi open then, for any subset \(A\) of X, \(f(scl(A)) \subseteq cl(f(A))\).

Further theorem is the extension of the work presented by Bohn [1].

**Theorem 3.7.** Let \((X, , \mu)\) be a semi generalized topological group. Then for each generalized open set X subset A of X, A⁻¹ is semi generalized open.

**Proof.** Let A be generalized open in X, there exists a generalized open set U in X, such that,

\[
U \subseteq A \subseteq cl(U) \quad \text{(By [5])}
\]

\[
\Rightarrow U^{-1} \subseteq A^{-1} \subseteq cl(U)^{-1}
\]

Because, \((X, , \mu)\) is semi generalized topological group.

**Lemma 3.8.** Let A be G-topological space. If \(A \subseteq X\) is G-semi open and \(A \subseteq B \subseteq cl_g(A)\), then B is G-semi open.

**Proof.** Let \(A \subseteq B \subseteq cl_g(A)\). Since A is semi G-open then there exists a G-open set O such that \(O \subseteq A \subseteq cl_g(O)\).

\[
\Rightarrow 0 \subseteq A \subseteq cl_g(O)
\]

This proves that B is semi G-open in X.

**Theorem 3.9.** Let \((X, , G)\) be a G-S-topological group. Then the multiplication mapping

\[
M: G \times G \to G\]

\[
defined by m((x, y)) = x * y
\]

is semi G-continuous for each \(x, y \in X\).

**Proof.** Let \(x, y \in X\) and W be a G-open set containing \(x * y\), since X is G-semi open sets U and V containing \(x^{-1}\) and \(y^{-1}\), such that

\[
U * V^{-1} \subseteq W
\]

\[
\Rightarrow x * y \in U * V^{-1} \subseteq W
\]

\[
m((x, y)) = x * y \in U * V^{-1} \subseteq W
\]

\[
\Rightarrow m(U * V^{-1}) = U * V^{-1} \subseteq W
\]

Since V is semi G-open set containing \(y^{-1}\), therefore, by Theorem 1.6, \(V^{-1}\) is G-semi open set containing \(y\). Moreover, by Theorem 2, \(U \times V^{-1}\) is G-semi open set containing \((x, y)\). Hence \(m\) is semi G-continuous for each \((x, y)\).

By Theorems 2.5 and 2.7, it is clear that every G-topological group is G-S-topological group.
**Theorem 3.10.** Let \((X,\ast,\mathcal{G})\) be a \(G\)-s-topological group and \(A\) be any \(G\)-open set in \(X\). Then, for each \(x \in X\), \(x \ast A\) both are \(G\)-semi open in \(X\).

**Proof:** Let \(z \in A \ast x\). This gives \(z = y \ast x\) for some \(y \in A\).

\[ z = y \ast x \Rightarrow z = y \ast x^{-1} \in (A \ast x)^{-1}. \]

Since, \(X\) is \(G\)-s-topological group, therefore, for \(G\)-open set \(A\) containing \(y\), there exist \(G\)-open set \(U\) and \(V\) containing \(z\) and \(x\) respectively, such that

\[ U \ast V^{-1} \subseteq A. \]

Or

\[ z \ast x^{-1} \in U \ast x^{-1} \subseteq U \ast V^{-1} \subseteq A. \]

This gives \(z \in A \ast x\). This proves that \(A \ast x\) is \(G\)-semi open set.

**Theorem 3.12.** Let \((X,\ast,\mu)\) be semi \(G\)-topological group. If \(A\) is generalized open and \(B \subseteq X\), then \(A \ast B, B \ast A\) is generalized semi open in \(X\).

**Proof.** Let \(x \in B\) and \(z = A \ast x\)

\[ z = y \ast x \]

or, for some \(y \in A\), implies,

\[ z \ast x^{-1} \in A \]

Where \(A\) is generalized open set in \(X\), therefore, by the hypothesis, i.e., \(X\) is semi generalized topological group, there exist generalized semi open set in \(X\) containing \(z\) and \(V\) containing \(x\) such that,

\[ U \ast V^{-1} \subseteq A \]

or

\[ U \ast x^{-1} \subseteq U \ast V^{-1} \subseteq A \]

or

\[ U \subseteq A \ast x. \]

This implies that for each point \(z \in A \ast x\), we can find a generalized semi open set \(U\) containing \(z\) such that \(U \subseteq A \ast x\). This means \(A \ast x\) is generalized semi open. Since the union of semi open sets is generalized semi open, therefore,

\[ A \ast B = \bigcup_{x \in B} A \ast x \]

is generalized semi open.

**Lemma 3.13.** Let \((X,\ast,\mathcal{G})\) be a semi \(G\)-topological group and let \(B\) be the base at identity element \(e\) of \(X\). Then, for every \(U \in B\), there is an element \(V \in SO(X)\); so that following holds,

1) \(V^2 \subseteq U\)
2) \(V^{-1} \subseteq U\)
3) \(V \ast x \subseteq U\), for each \(x \in U\).

**Theorem 3.14.** Let \((X,\ast,\mathcal{G})\) be a semi \(G\)-topological group. Then each left(right) translation \(l_g : G \rightarrow G\) \((g : G \rightarrow G)\) is \(G\)-semi homeomorphic.

**Proof:** It is obviously bijective map and \(l_g : G \rightarrow G\) is semi \(G\)-continuous containing \(g\), therefore, \(G\)-semi open set \(U\) containing \(x\) such that \(l_g(U) \subseteq W\). Again, let \(V\) be a \(G\)-open set in \(G\), then \(l_g(V) = V \ast g\) is semi \(G\)-open. That is the image of \(G\)-open set is semi \(G\)-open. This proves that \(l_g\) is \(G\)-semi homeomorphic.

**Note:** Let \((X,\ast,\mathcal{G})\) be semi \(G\)-topological group and \(x \in X\). Then for any local base \(\beta_e\) and \(e \in G\), then each of the families \(\beta_x = \{x \ast U, U \in \beta_e\}\) and \(\{x \ast U^{-1}, U \in \beta_e\}\) is a semi \(G\)-open neighborhood system of \(x\).
