EFFECTS OF MOTORIC ABILITIES ON THE SPECIFIC MOTORIC ABILITIES OF FOOTBALL PLAYERS AGED BETWEEN 14 AND 16

Introduction
In various articles and papers we often come across the statement “football – the most important secondary thing in the world”. This in simple terms explains the great popularity that football enjoys.

Modern football players need to possess the following distinctions: morphological characteristics, motoric and specific motoric abilities, situation judging abilities and certain psychological characteristics.

The research goal of this article is to examine the effects of motoric abilities on the specific motoric abilities of football players aged from 14 to 16.

In line with the research goal, the following task was set: to establish the influence of the predictor system of six motoric tests on the two-criterion specific motoric tests of agility and coordination.

Methods
The group of tested persons in this research consists of 54 male football players aged from 14 to 16 who have active training in football club in Prishtina. Their active football experience was two years at least.

The sample of variables covers 6 motoric and 2 specific motoric tests.

From motoric tests the following items were used (as a predictor system of variables):
1. Long jump (LJ);  
2. 20-meter running (20M);  
3. Throwing medical ball (TMB);  
4. Sit-ups (SU);  
5. Raising the trunk in 30 seconds (RT); and  
6. Hanging shaft (HS).

From the specific motoric tests for agility and coordination the following was used as a criteria variable:  
1. T-test (TT); and  
2. Illinois test (IT).

For each space individually calculation was carried out for basic statistic indexes and the effects of the motoric abilities on the specific motoric abilities are established through linear regression analysis.

The data has been analysed using statistic software Statistics 7.0.
Results

From the obtained results presented in two tables (table 1 and table 2), the conclusion is the following: the motoric variables have significant participation in the prediction of success in acquiring specific motoric abilities that are an important part of football playing.

The predictor system of six motoric variables has statistically significant influence on the criterion variable T-test.

In the first case (table 1) the influence is at level 0.05 (p=0.05). The coefficient of multiple correlations is 0.48 and the coefficient of the determination is 0.27 and explained in percentage it is 27%.

Individually significant influence on the criterion has the variable Hanging shaft (HS) – p-level=0.03.

</tbody>
</table>

* R - coefficient of multiple correlation; RI – coefficient of determination; F – F-test; p – level of significance; Beta – standardized beta coefficient; Partial Cor. – coefficient of partial correlation; t – t-test; and p-level – level of significance for predictor variable.

The predictor system of six motoric variables has statistically significant influence on the criterion variable Illinois test.

In the second case (table 2) the influence is at level 0.00 (p=0.00). The coefficient of multiple correlation is 0.55 and the coefficient of the determination is 0.31 and explained in percentage it is 31%.

Individually significant influence on the criterion has the variable Long jump (LJ) – p-level=0.00.

On the ground of the modest contribution that this completed research can offer, we think that the used predictor variables are adequately counted.

They can certainly be used for assessing (in prediction) the specific motoric of football players.

* R - coefficient of multiple correlation; RI – coefficient of determination; F – F-test; p – level of significance; Beta – standardized beta coefficient; Partial Cor. – coefficient of partial correlation; t – t-test; and p-level – level of significance for predictor variable.

Discussion

Results similar to the ones obtained in this research are also present in the works of Malina (2003), Swenson & Drust (2005), Vaeyens et al. (2006), Reilly et al. (2000) and other eminent authors. We can confidently state that activities in which the trained football players were engaged in show promise of high sport achievements.
