**1. Introduction**

*Crataeva nurvala* (*C. nurvala*) Buch–Ham (Family: Capparidaceae) commonly known as Varuna, is an evergreen tree indigenous to India [1]. It is a medium sized branched deciduous plant distributed throughout the river banks of southern India and other tropical, sub-tropical countries of the world, wild or cultivated [2]. It requires dry, hot climate and shady places to grow effectively [1]. Vedic literatures described its potentiality as blood purifier and to maintain homeostasis [1]. Its bark is hot, bitter at first and then sweet sharp taste, easy to digest, stomachic, laxative, anthelmintic, expectorant and anti-pyretic [1]. Moreover, pharmacological study reveals the potentiality of *C. nurvala* extract and its active principle, particularly lupeol as diuretic, anti-inflammatory, antioxidant, cardio-protective, hepatoprotective, lithotriptic, anti-rheumatic, anti-periodic, contraceptive, anti-protozoal, rubifacient and vesicant [1]. An attempt has been taken to compile the up to date information regarding phytochemical and ethnopharmacological aspects of *C. nurvala*.

**2. Taxonomy and Ethnobotany**

The genus *Crataeva*, named in honor of the Greek botanist *Crataevas* comprises about 70 species distributed mainly in the warmer (tropical) parts of the world. Among them *C. nurvala* shows highest bio-diversity in India [1]. The taxonomical classification of *C. nurvala* is as follows

- **Kingdom:** Plantae
- **Division:** Magnoliophyta
- **Phylum:** Tracheophyta
- **Class:** Magnoliopsida
- **Order:** Brassicales
- **Class:** Magnoliopsida Brongniart
- **Family:** Capparidaceae A.L. de Jussieu, nom. cons.
- **Genus:** Crataeva
- **Species:** nurvala (Buch–Ham)

The trade name of this tree is three leaved capper as it contains “trī-pārna” or trifoliate leaves. Flowers are whitish to milky white; 5–8 cm in diameter; polygamous and fragrant. Inflorescences appears as dense terminal corymbs; bracts minute. Fruit is berry, globes with woody rind with embedding seeds in the yellow pulp. The outer surface of bark is wrinkled and grey-white in colour, covered with large number of lenticels. The tree flowers and fruits in December–May and June–August [1].
3. Traditional uses and ethno–pharmacology

*C. nurvala* traditionally being used in treating blood flow, waste elimination and breathing problems, fever and metabolic disorders, joint lubrication, skin moisture, wound healing, memory loss, heart and lung weakness and weak immune system[]. In Unani system of medicine, the bark is used to promote appetite and to decrease the secretion of bile and phlegm[].

Folkloric uses suggest its potentiality as oxytosic, diuretic, laxative, anti-periodic, and bitter tonic[]. In tribal areas of Muzaffarnagar (Uttar Pradesh, India), the bark is used against urinary disorders including kidney and bladder stones, anti–emetic and as antidote in snakebite[]. Tribes of eastern India (Assamese, Khashi, Garo) apply the leaf paste against various joint disorders. Roots and barks are used as laxative and increase appetite and biliary secretion[]. Varunal, a traditional Ayurvedic poly–herbal formulation containing *C. nurvala* is used against hepatitis, edema, ascites, and arthritis[]. Pallaypatty villagers of Tamil Nadu, India, use leaves and bark to cure jaundice, eczema, rabies, fever and to control birth[].

In Philippines, leaves are prescribed during irregular menstruation whereas the bark is used to cure convulsions and tympanites[]. The tribes of Kango and Yurubas of Africa use leaf paste as counter irritant[].

4. Phytochemistry

Preliminary phytochemical screening reveals the plant is rich in triperpenoids, saponins, flavonoids, phytosterols, alkaloids and glucosilinates[]. Phytoconstituents like lupeol and its acetate, ceryl alcohol, friedelin, cadabicine diacetate, betulinic acid and diosgenin have been isolated from the stem bark[]. Fruits contain glucocapparin, triacontanol, cetyl and ceryl alcohol. Leaves showed the presence of L stachyhydrine, dodecanolic anhydride, methyl pentacosanoate, kaemferol–0– α –D–glucoside and quercetin–3–0– α –D–glucoside[]. Root bark contains rutin, quercitin, varunol and β –sitosterol[]. The isolated compounds of different classes are summarized in Table 1 and the structures are displayed in Fig. 1.

5. Pharmacological activity

5.1 Treatment of urinary disorders

5.1.1 Urolithiasis
Lupeol (50 mg/kg) showed potent anti-urolithiatic activity in-vivo in a dose dependant manner. Results indicated lupeol normalizes specific gravity, pH, ketone, bilirubin, blood, urobiolinogen and protein in urine. Moreover, total leucocyte count reduced by 73% as compared to that of control. Decoction of *C. nurvala* (800 mg/kg) increases the force of contraction, reducing the volume of residual urine in patients with prostatic hypertrophy.

5.1.2 Hyperoxaluria
Administration of lupeol and betulin (35 mg/kg/day, p.o.) for 21 days to hyperoxaluric rats minimized the tubular damage and reduced crystal deposition in the kidneys. Lupeol (25 mg/kg) reduces the risk of stone formation in experimental lithogenic animals by preventing oxalate and crystal-induced per-oxidative changes in renal tissues and increase urinary excretion of oxalate associated with reduction in citrate and glycosaminoglycans.

Administration of *C. nurvala* decoction in experimental models reduces urinary calcium excretion while increase in sodium and magnesium significantly and thus alter the relative proportions of urinary electrolytes, regulate calculus formation. It also lowered the levels of intestinal (Na+, K+)–ATPases.

UriflowTM (BioNeurix), a formulation containing *C. nurvala* reduces size of kidney stones to 50% patients diagnosed with crystal urea.

5.1.3 Urinary tract infection
Chloroform extract of stem bark of *C. nurvala* found to be effective against both gram positive (*B. cereus*) and gram negative (*E. coli*) mediated urinary tract infection and prostatitis at minimum inhibitory concentration (MIC) 62.5 μg/ml.

The diuretic potential of NR–AG–II, a poly-herbal formulation containing aqueous extracts of *C. nurvala* was studied in-vivo. The result was comparable with standard Furesemide.

PR–2000 (*C. nurvala* containing herbal formulation) at a dose of 2 tablets thrice daily for six months showed improvement in peak flow rate of urine and a subsequent decrease in sonographic size of prostate in human volunteers with benign prostatic hyperplasia (BPH).

Further, clinical trial with another herbal formulation of *C. nurvala* Himplasia® was found to possess 5−α–reductase inhibitory and α–adrenoceptor antagonist activity. 5−α–reductase inhibition blocks the conversion of testosterone to dihydro–testosterone, the major hormone in prostatic cells responsible for BPH.

5.2 Nephroprotective activity
Alcoholic extract of *C. nurvala* (250 and 500 mg/kg for 10 days) showed protective activity against cisplatin (5 mg/kg) induced nephrotoxicity. The results suggested, alcoholic extract significantly altered the dysfunction of renal proximal tubule cells by decreasing the concentration of blood urea nitrogen, creatinine, lipid peroxidation, glutathione and catalase.

Administration of aqueous extract of *C. nurvala* (200 and 400 mg/kg) for 28 days showed protective activity against ethylene glycol induced nephrotoxicity.

5.3 Hepatoprotective activity
The hepatoprotective effect of hydroalcoholic extract of the whole plant of *C. nurvala* (400, 600 and 800 mg/kg/day) was investigated in-vivo against carbon tetra chloride induced hepato–toxicity. Result indicated extracts booster antioxidant enzyme level and restore serum bilirubin, cholesterol level compared to disease state.

5.4 Anti–arthritic and anti–inflammatory activity
Aqueous extract of *C. nurvala* stem bark and ω–3 fatty acid [Lupeol–EPA] (50mg/kg body weight) was tested in-vitro in adjuvant induced arthritis in rats. Result indicated decreased activity of lysosomal enzymes and glycoproteins nearly to that of control. The study was compared with standard indomethacin. Intra–peritoneal administration of lupeol and its ester (50mg/kg) isolated form *C. nurvala* showed protective activity against Complete Freund’s Adjuvant (CFA) induced arthritis in rat paw edema. Lupeol modulates the expression or activity of several molecules such as cytokines IL−2, IL4, IL5, II−β, proteases, α-glucosidase, cFLIP, Bcl−2 and NF × B.

5.5 Cardioprotective activity
Lupeol and its ester (50 mg/kg/day for 10 days) showed cardioprotective potential against cyclophosphamide (200 mg/kg) induced oxidative stress in vitro. Results indicated decline proportion of lactate dehydrogenase and creatine phosphokinase in serum while improvement in cardiac tissue along with significant increase in antioxidant enzymes.

Moreover, hypo–cholesteromic activity of ethanolic extract of *C. nurvala* was established in-vivo. Results showed augmented activity of transmembrane marker enzymes like Na+–K+–ATPase, Ca2+–ATPase and Mg2+–ATPase along with decreased level of total cholesterol, triglycerides and phospholipids in blood. The activity may be associated with rapid excretion of bile acids that regulate cholesterol homeostasis causing low absorption of cholesterol.
5.6 Anti-protozoal activity

In-vitro assay revealed anti-protozoal potential of extracts of *C. nurvala* and isolated active compound lupeol against malaria, leishmaniasis and trypanosomiasis occurred by various Plasmodium, Leishmania and Trypanosoma species [1].

5.7 Anti-diabetic activity

*C. nurvala* stem bark extracts (500 mg/kg) showed potent anti-diabetic activity in alloxan-induced diabetes in vivo. Results were comparable with standard glibenclamide (600 μg/kg). The effect may be due to increase insulin secretion from β-cells of islets of Langerhans or its release from bound insulin due to enhanced glucose utilization by peripheral tissues [1].

5.8 Anti-nociceptive activity

Ethanolic extract of *C. nurvala* stem bark (250–500 mg/kg p.o.) was evaluated for anti-nociceptive activity in vivo by acetic acid induced analgesic model. Results suggested the anti-nociceptive effect was peripherally mediated. Hence, can be useful in the treatment of inflammatory arthritic conditions [1].

5.9 Wound healing activity

Ethanolic extract of root bark of *C. nurvala* (150 and 300 mg/kg) showed wound healing and collagenation potential in vivo. Moreover, supportive in-vitro studies suggest an increase level of antioxidant enzymes on granuloma tissue which further support the wound healing potential [1].

5.10 Anti-cancer activity

Topical application of Lupeol (200 μg/mouse) prevents 7,12-dimethylbenz[a]anthracene [DMBA]– induced DNA damage in murine skin [39]. Recently, Lupeol was shown to inhibit Benzo[a]pyrene, a potent mutagen induced genotoxicity in mouse model. Study showed pre-treatment with Lupeol (1 mg/kg) for 7 days prior to Benzo[a]pyrene administration significantly decreased genotoxicity and caused increase in mitotic index [1].

Moreover, cell line study revealed that anti-tumor effects of lupeol was associated with modulation of signaling pathways such as nuclear factor kappa B (NFκB) and the phosphatidylinositol 3-kinase [PI3K] /Akt (protein kinase B pathway), which play an important role during tumorigenesis. Further, lupeol significantly inhibit ornithine decarboxylase activity which is a well known biomarker of tumor promotion [1].

5.11 Antipyretic activity

Ethanolic extract of *C. nurvala* (200 and 400 mg/kg) showed potent anti-pyretic activity against typhoid vaccine induced pyrexia in rabbits. The result was comparable with paracetamol (100 mg/kg p.o.), standard antipyretic drug [13].

5.12 Anti-fertility activity

Administration of aqueous and ethanolic extract of *C. nurvala* (300 and 600 mg/kg/day) for 8 days showed anti-fertility activity in dose dependent manner. The activity may be due to modified estrogenic activity, causing the expulsion of ova from the urethral tube, disrupting the luteotropic activity of the blastocytes [1].

6. Safety and toxic profile

Topical application of the leaves of *C. nurvala* was reported to cause reddening and blistering in rodents. The decoctions of the root bark and stem bark appear to be well tolerated. The LD₅₀ of 50% ethanolic extract of stem bark was found to be more than 1000 mg/kg i.p. to adult rats [46]. No toxic effects have been seen on the human body with *C. nurvala* consumption.

A summary of various pharmacological activities of *C. nurvala* is mentioned in table 2.

7. Conclusion

For ages, *C. nurvala* has been used for the treatment of various ailments in traditional and folklore medicine. Of the phytoconstituents reported from different parts of *C. nurvala*, lupeol and its acetate are the predominant bioactive constituents. Although the constituents responsible for the pharmacological properties of the plant seem to have been determined, the molecular mechanisms of most of these principles are still unknown. The bioassay guided isolation, identification of the bioactive components is essential and in depth research is also crucial to reveal the structure–activity relationship of these active compounds. Based on these facts, the authors made an upto date information highlighting the current ethno–pharmacological and phytochemical status of the plant.

8. Conflict of interest statement

We declare that we have no conflict of interest.
