**ABSTRACT**

**Objective:** To determine antioxidant and cytotoxic activity of two flavanones, pinocembrin (1) and pinostrobin (2) from the rhizomes of *Kaempferia pandurata*. The chemical structures of both compounds were determined based on spectroscopic data, including UV, IR, MS and NMR spectra.

**Methods:** The antioxidant activities of pinocembrin (1) and pinostrobin (2) were assayed by using 2,2-diphenyl-1-picrylhydrazyl. Cytotoxic assay was done by using brine shrimp lethality test, and cytotoxic properties was tested against murine leukemia P–388 cells.

**Results:** Compounds 1–2 were evaluated for their antioxidant properties against DPPH, showing their IC₅₀ were 5 816 and 6 268 µmol/L; brine shrimp lethality test: LC₅₀ 23.3 and 60.5 µg/mL; murine leukemia P–388: IC₅₀ 176.3 and 218.5 µmol/L.

**Conclusions:** The results indicated that pinocembrin (1) was slightly more active than pinostrobin (2).

**KEYWORDS**

Flavanone, Pinocembrin, Pinostrobin, *Kaempferia pandurata*, Antioxidant, Cytotoxic

---

**1. Introduction**

*Kaempferia pandurata* Robx. (*K. pandurata*) syn. *Boesenbergia pandurata* Robx. (local name: Temu Kunci) belongs to the family Zingiberaceae. In Indonesia, the rhizomes of this plant are extensively used as aavouring in traditional food, and it is also used in traditional medicine as an aphrodisiac, and for the treatment of asthma, diarrhea, fever, and colic disorder. This plant has been shown to produce a number of flavonoid and essential oil compounds[1–3]. In continuation of these chemical investigations, we have examined *K. pandurata* Robx. and succeeded in isolating two flavanones, namely pinocembrin (1) and pinostrobin (2). This paper discussed the structure elucidation of the two flavanones. Also, free radical scavenging and cytotoxic properties of compounds 1–2 against DPPH radical, brine shrimp, and murine leukemia P–388 cells are briefly described.

**2. Materials and methods**

**2.1. General experimental procedures**

UV and IR spectra were measured with a Beckman DU 7500 and an FT–IR Spectrum One Perkin–Elmer instrument.

respectively. $^1$H and $^{13}$C NMR spectra were recorded with a JEOL ECA400 spectrometer operating at 400 ($^1$H) and 100 ($^{13}$C) MHz, using residual and deuterated solvent peaks ($^\delta_{H}$ 2.04 and $^\delta_{C}$ 29.8, respectively) as reference standards. Mass spectra were obtained with a VG Autospec mass spectrometer (EI mode). Vacuum liquid chromatography and column chromatography were carried out using Si gel 60 G, and for TLC analysis, precoated Si gel 60 F254 plates were used. Solvents used for extraction and separation were of technical grades that were distilled before use.

2.2. Plants material

Samples of rhizomes of *K. pandurata* (1.0 kg) were collected from research garden, Faculty of Science and Technology District, Airlangga University, Suraehay, Indonesia. The plant was identified by the staff at the Herbarium Bogoriense, Bogor Botanical Garden, Bogor, Indonesia. and a voucher specimen had been deposited at the herbarium. The rhizomes were cleaned, air dried under the shade, cut into small pieces and milled.

2.3. Extraction and isolation of pinocembrin (1) and pinostrobin (2)

The dried and powdered rhizomes of *K. pandurata* were macerated with $n$-hexane and then with methanol two times at room temperature, after $n$-hexane solvent evaporation gave a solid fraction, and recrystallization with methanol gave a needle like crystal of pinostrobin (2). Furthermore, methanol extract was redissolved in methanol-water (9:1) and partitioned into ethylacetate. The ethylacetate extraction fraction was then fractionated using vacuum liquid chromatography eluting with mixtures of $n$-hexane-ethylacetate (9:1, 4:1 and 7:3) to give three major fractions A-C. Fraction B was separated with column chromatography and eluting with mixtures of $n$-hexane-ethylacetate (9:1, and 4:1) gave a yellow solid. Recrystallization with methanol to yield a yellow solid of pinocembrin (1).

Pinocembrin (1), yellow solid, m.p. 202–204 °C, UV (MeOH) $\lambda_{max}$ nm (log $\varepsilon$) : 228 (3.91), 292 (4.06), and 323 sh (3.67) nm, (MeOH-AlCl$_3$) $\lambda_{max}$ nm (log $\varepsilon$) : 225 (3.99), 297 (4.11), and 382 sh (3.16) nm. IR (KBr) $\nu_{max}$: 3435 (OH), 3000, 2910 (CH aromatic), 1641 (conj. C=O), and 1595, 1570 (C=C aromatic) cm$^{-1}$. EIMS: m/z (%) : 256, 240, 222, 204, 186, 168, 150 (40.2), 138 (40.2), 116 (40.2), 94 (25.2), 72 (25.2), 60 (25.2), 39 (13.6), 28 (13.6), 27 (13.6), 19 (13.6), 18 (13.6), 17 (13.6), 15 (13.6), 14 (13.6), 13 (13.6), 11 (13.6), 9 (13.6), 8 (13.6), 7 (13.6), 6 (13.6), 5 (13.6), 4 (13.6), 3 (13.6), 2 (13.6), 1 (13.6). $^1$H NMR (100 MHz in acetone d6), $^\delta_{H}$ ppm: 6.18 (1H, br, s, 5-OH), 7.57 (3H, m, H–3‘,4’,5’), 7.45 (2H, m, H–2‘,6’), 6.08 (1H, d, $J=2.2$ Hz, H-6), 5.49 (1H, dd, $J=14.0$ Hz, H-2), 3.06 (1H, dd, $J=12.0$; 14.0 Hz, H–3$’_{\alpha}$), and 2.78 (1H, dd, $J=4.0$; 14.0 Hz, H–3$’_{\beta}$). $^{13}$C NMR (100 MHz in acetone d6), $^\delta_{C}$ ppm: 197.3 (C–4), 168.5 (C–7), 165.4 (C–5), 164.7 (C–8a), 140.4 (C–1’), 129.7 (C–3’,5’), 129.6 (C–4’), 127.3 (C–2’,6’).

Pinostrobin (2), white crystal, m.p. 96–98 °C, UV (MeOH) $\lambda_{max}$ nm (log $\varepsilon$) : 232 (3.93), 290 (4.09), and 325 sh (3.68) nm. EIMS: m/z (%) : 270 (M, 100, base peak), 193 (76.2), 166 (80.4), 138 (40.2), 101 (21.1), and 77 (16.9). $^1$H NMR (400 MHz in acetone d6), $^\delta_{H}$ ppm: 12.18 (1H, br, s, 5–OH), 7.57 (3H, m, H–3‘,4’,5’), 7.45 (2H, m, H–2‘,6’), 6.08 (1H, d, $J=2.2$ Hz, H-6), 5.49 (1H, dd, $J=14.0$ Hz, H-2), 3.76 (3H, s, 7-OCH$_3$), 3.12 (1H, dd, $J=12.8$; 16.4 Hz, H–3$’_{\alpha}$), and 2.80 (1H, dd, $J=3.8$; 16.4 Hz, H–3$’_{\beta}$). $^{13}$C NMR (100 MHz in acetone d6), $^\delta_{C}$ ppm: 196.8 (C–4), 168.1 (C–7), 164.4 (C–5), 163.8 (C–8a), 140.0 (C–1’), 129.5 (C–3’,5’), 129.3 (C–4’), 127.2 (C–2’,6’), 103.0 (C–4a), 95.0 (C–8), 94.0 (C–6), 79.2 (C–2), 56.0 (7–OCH$_3$), and 43.6 (C–3).

2.4. DPPH scavenging activity test

The antioxidant activity of two flavonones and ascorbic acid (positive control) were measured in triplicate, based on the method used by Muller. The pinocembrin, pinostrobin, and ascorbic acid were diluted with methanol to prepare sample solution equivalent to 10000, 5000, 2500, 1000, and 500 $\mu$mol/L. A methanolic solution (100 $\mu$L) was placed in a cuvette, and 100 $\mu$L acetate buffer (100 mmol/L, pH 5.5) then 50 $\mu$L 5.10$^{-4}$ mol/L in methanol was added. The mixture was incubated at 20 °C for 30 min[6]. Absorbance of the pinocembrin, pinostrobin, and ascorbic acid were measured at 517 nm. The inhibition percentage (%) of radical scavenging activity was calculated using the following equation: Inhibition (%)=$\frac{A_0-A_s}{A_0}$×100

Where $A_0$ is the absorbance of the control reaction (containing all reagents except the test compound, and $A_s$ is the absorbance of the test compound.

2.5. BSLT bioassay

The cytotoxic effect of pinocembrin, and pinostrobin were evaluated by LC$_{50}$ of brine shrimp lethality test. *Artemia salina* Leach (brine shrimp eggs) were placed in 1 L of sea water, aerated for 2 d at 37 °C for the shrimp to hatch become nauplii. After 48 h, ten brine shrimp nauplii were placed in a small container filled with sea water. The compound (1), and (2) were dissolved in dimethylsulphoxide (DMSO) separately and 3 graded doses 1, 5, 10, 25, 50, and 100 $\mu$g/mL respectively were used for 5 mL sea water containing...
10 brine shrimp nauplii in each group. The lethality of brine shrimp was observed after 24 h of treatment was given[5]. Probity analysis was used to determine lethal concentration (LC₅₀) of pinocembrin, and pinostrobin on nauplii.

2.6. MTT assay

Living cells 3×10⁴/mL were plated in 96–well culture dishes. Plates was incubated at 37 °C in humidified CO₂ incubator for 24 h. After the cells adhered to the plates, 10 µL medium containing one of five different concentrations of compound 1–2 were added. Plates was incubated incubated at 37 °C in humidified CO₂ incubator for 48 h. After incubation, medium was removed from the wells and 150 µL of fresh medium+50 µL MTT was added. Plates was incubated at 37 °C in humidified CO₂ incubator for 4 h. Four hours later, MTT was removed and insoluble formazan was dissolved in 50 µL DMSO. Optical density was measured on micro plate reader at 550 nm[6]. IC₅₀ was calculated according to One–way analysis of variance (ANOVA).

2.7. Statistical analysis

Statistical analysis was performed using One–way analysis of variance (ANOVA) and followed by least square difference. Results were expressed as mean±SD from three replications. P<0.01 was considered significant.

3. Results

3.1. Phytochemical

Extraction of the dried milled rhizomes of K. pandurata with n–hexane and methanol gave a fraction which was separated by column chromatography to give pinocembrin (1), and pinostrobin (2). The molecular ion at m/z 256 one of flavanone had a formula C₁₅H₁₂O₄ and was identified as pinocembrin (5,7–dihydroxy flavanone) by comparing data with reported values[7]. The UV spectrum of 1 showed absorption maxima at 228, 292, and 323 sh nm, an absorption maxima at 228, 292, and 323 sh nm, an characteristic for H-2, H-3ax, and H-3eq a typical ABX structure.

The radical scavenging against DPPH, brine shrimp, and cytotoxic data against murine leukemia P-388 cells were evaluated according to the method of MTT assay of pinocembrin (1), and pinostrobin (2) are presented in Table 1.

4. Discussion

The ginger family contains about 50 genus and 1300 species, which are distributed in tropical regions. K. pandurata Robx. used as flavouring agents, spices and herbal medicine.

Two flavonoid compounds of flavanone type have been isolated from the rhizomes of K. pandurata and were identified pinocembrin (1), and pinostrobin (2). The structure of both compounds has been elucidated based on spectroscopic methods and comparison of their physical data. The results indicate that compounds 1–2 to give very weak activities as radical scavenging than positive control (ascorbic acid). Preliminary cytotoxic evaluation of compounds 1–2 was carried out against brine shrimp lethality test showed potent activities[7]. However, on cytotoxic evaluation against murine leukemia P-388 cells using MTT assay of compounds 1–2 was inactive[9]. The structure–activity relationship of compounds 1–2 against radical scavenging, brine shrimp, and cytotoxic data against murine leukemia P-388 cells suggested that the presence of hydroxyl group at C-7 on pinocembrin structure tend to be more active than the methoxyl group at C-7 on pinostrobin structure.

Two flavanones, pinocembrin (1), and pinostrobin (2) have been isolated from the rhizomes of K. pandurata Robx., a species belongs to the family Zingiberaceae. The radical
scavenging and cytotoxic activities of compounds 1–2 were evaluated against DPPH, brine shrimp, murine leukemia P–388 cells which showed that compound 1 is slightly more active than compound 2.

**Conflict of interest statement**

We declare that we have no conflict of interest.

**Acknowledgements**

This research was supported by Directorate of Higher Education, Ministry of National Education, Republic of Indonesia (Diks Suplemen Airlangga University No. 54/ SK/2012). We would like to thank to Mr. Ismail Rahman staff Herbarium Bogorienses, Bogor for identification of the species. We also thank Prof. Dr. Emilio Ghisalberti from Department of Chemistry, University of Western Australia for NMR spectra measurements.

**Comments**

**Background**

The research is an investigation of phytochemical work of Indonesian medicinal plants aiming to find flavonoid compounds from the rhizomes of *K. pandurata* Robx. with antioxidant and cytotoxic activities.

**Research frontiers**

This research include phytochemical, elucidation structure of both flavonoids, antioxidant and cytotoxic activities, and structure–activity relationship of flavonoid from rhizomes of *K. pandurata* Robx. The cytotoxic effect of the isolated compounds was evaluated against P–388 and by using brine shrimp lethality test while the antioxidant activities was carried out using 2,2-diphenyl-1-picrylhydrazyl.

**Related reports**

Flavonoid compounds from of *K. pandurata* Robx. and their biological activity have been reported. However, the reported about antioxidant and cytotoxic activities from pinocembrin and pinostrobin which has not been investigated by other workers.

**Innovations & breakthroughs**

*K. pandurata* Robx belongs to medicinal plants used in traditional medicine as an aphrodisiac, asthma, diarrhea, and fever. In the present study, authors have explained the phytochemical, elucidation structure, antioxidant and cytotoxic activities of *K. pandurata* Robx.

**Applications**

*K. pandurata* Robx belongs to medicinal plants in Indonesia. This herb contains a lot of active compound that have activity as antioxidant, anticaner, and inflammatory. The isolation of two flavonoids is interesting to study of structure–activity relationship.

**Peer review**

This is a good study in which the authors explained the isolation of flavonoid compounds from the rhizomes of *K. pandurata*. This paper discusses the structure elucidation of the two flavanones. Also, structure–activity relationship against DPPH radical and cytotoxic activity.
