The paper presents a critical review of the Dolichopodidae family in the Astrakhan State Nature Biosphere Reserve (Russia). In total, 23 species from the Dolichopodidae family were indicated for this Protected Area. Four of these species have been recorded for the first time for both Europe and Russia: Asyndetus albipalpus, Asyndetus chaetifemoratus, Chrysotus dorli, Hercostomus rubroviridissimus. In addition, Dolichopus jaxarticus and Sciapus subvicinus are new species for Russia. Twenty species (Asyndetus albipalpus, Asyndetus chaetifemoratus, Asyndetus latifrons, Campsicnemus filipes, Campsicnemus simplicissimus, Chrysotus cilipes, Chrysotus dorli, Dolichopus calinotus, Dolichopus ciliifemoratus, Dolichopus latilimbatus, Dolichopus jaxarticus, Hercostomus convergens, Hercostomus rubroviridissimus, Medetera diadema, Medetera plumabella, Nemtoproctus longifilus, Poecilobothrus bigoti, Rhaphium penicillatum, Sciapus longulus, Sciapus subvicinus) are firstly recorded for the Astrakhan region. To date, 34 Dolichopodidae species are known in the Astrakhan region. However, further studies of the Dolichopodidae fauna in Protected Areas are needed for a more comprehensive knowledge on this Diptera family in Russia and in Eurasia as a whole.

**Key words:** Astrakhan region, insects, long-legged flies, new locality, Protected Area

**Introduction**

According to the fauna of the family Dolichopodidae of the Astrakhan region, fragmentary information is available in the literature. In Stackelberg (1933) and Negrobov et al. (2013), two species are mentioned for the Astrakhan region: Dolichopus zernyi Parent, 1927 and Hydrophorus praecox (Lehmann, 1822).

In the article of Grichanov (2011) related to the Astrakhan region, mainly from the vicinity of Lake Bashkunchak, two new species (Campsicnemus konstantini Grichanov, 2011, Vetimicrotes baskunchakensis Grichanov, 2011) were described, and the following seven species were indicated for the first time for this region: Campsicnemus magius (Loew, 1845), Chrysotus suavis Loew, 1857, Rhaphium antennatum (Carlier, 1835), Rhaphium micans (Meigen, 1824), Syntormon filiger Verrall, 1912, Syntormon pumilus (Meigen, 1824), Thinophilus flavipalpis (Zetterstedt, 1843). Grichanov (2013) noted Asyndetus longicornis Negrobov, 1973 from the Astrakhan region. Some data on the Dolichopodidae fauna of the Astrakhan State Nature Biosphere Reserve were published in conference proceedings (Lopyreva et al., 2014; Selivanova, 2016).

This study was aimed to review and generalise the whole material on Dolichopodidae fauna in the Astrakhan State Nature Biosphere Reserve (Russia).

**Material and Methods**

Material was collected by students of the Voronezh State University during field practice in the Astrakhan State Nature Biosphere Reserve (Fig. 1), using yellow pan traps. For this purpose, water was poured into the yellow pan traps with detergent. Then the captured specimens were transferred into 70% alcohol. In total, 1490 specimens were collected by G.B. Lopyreva and M.Yu. Anokhin in 2014, and by S.A. Bykovsky in 2017.

The vegetation cover consists of hygrophytes and hydrophytes. At this site, hydrophytes are represented by communities of Phragmites australis (Cav.) Trin. ex Steud. and Typha angustifolia L. (Fig. 2). The group of hydrophytes includes Nelumbo nucifera Gaertn., Sparganium erectum L. s.l., Butomus umbellatus L., Sagittaria sagittifolia L., and Alisma gramineum Lej. (Fig. 3).

**Fig. 3.** Habitat of the *Dolichopus* species. Astrakhan State Nature Biosphere Reserve, Damchiksky branch, Bystraya channel.
Results and Discussion

A list of species of the Dolichopodidae family known in the Astrakhan State Nature Biosphere Reserve is presented below. It includes a description of the material (collected specimens), current distribution and some special comments, where needed.

**Asyndetus albipalpus** Loew, 1871

Material. 250 ♂, 210 ♀, Trekhizbinsky branch, Trekhizbinka, 6–20.07.2017 (Bykovsky); 78 ♂, 56 ♀, Obzhorovsky branch, 13–20.07.2017 (Bykovsky); 4 ♂, Damchiksky branch, the bank of the River Bystraya, 24.06.2104 (Lopyreva, Anokhin). It is known from Uzbekistan and Tajikistan. This is the first record for Europe and Russia.

**Asyndetus chaetifemoratus** Parent, 1925

Material. 38 ♂, 20 ♀, Damchiksky branch, bank of the River Bystraya, 24–25.06.2014 (Lopyreva, Anokhin); 8 ♂, 13 ♀, Trekhizbinsky branch, Trekhizbinka, 6–20.07.2017 (Bykovsky). The species was described from Egypt. It is also known from Israel and Iraq. It is the first record for Europe and Russia.

**Asyndetus latifrons** (Loew, 1857)

Material. 2 ♂, 1♀, Trekhizbinsky branch, Trekhizbinka, 06.07.2017 (Bykovsky). It is the first record for the Astrakhan region.

**Campsicnemus filipes** Loew, 1859

Material. 1 ♂, 1♀, Damchiksky branch, bank of the River Bystraya, Obzhorovsky branch 16.06.2014 (Lopyreva, Anokhin). This is a rare species, known from South-West Europe, Morocco, and southern Ukraine. In Russia it was discovered in the Rostov region and Voronezh region. This is the first record for the Astrakhan region.

**Campsicnemus simplicissimus** Strobl, 1906

Material. 1 ♂, Obzhorovsky branch, shore of the channel Poldnevoe, 16.06.2014 (Lopyreva, Anokhin). It is known from Central and Southern Europe, Tajikistan and Turkey, in Russia: from Karachai-Cherkessia, Krasnodar region, Rostov region. This is the first record for the Astrakhan region.

**Chrysotus cilipes** Meigen, 1824

Material. 5 ♂, Damchiksky branch, banks of the River Bystraya, 06.26.2014 (Lopyreva, Anokhin). This is the first record for the Astrakhan region.

**Chrysotus dorli** Negrobov, 1980

Material. 8 ♂, 8 ♀, Damchiksky branch, Damchik settlement, 25–30.06.2014, shore of the channel Srednyaya Bystraya, 02–03.07.2014, Obzhorovsky branch, shore of the channel Poldnevoe, 10–15.07.2014 (Lopyreva, Anokhin). The species is described from Tajikistan. Currently, it is also known from Turkey. This is the first record for Europe and Russia.

**Dolichopus austriacus** Parent, 1927

Material. 60 ♂, 52 ♀, Damchiksky branch, Damchik settlement and Obzhorovsky branch, the shores of the channel Poldnevoe, 3–16.07.2014 (Lopyreva, Anokhin).

**Dolichopus calinotus** Loew, 1871

Material. 1 ♂, 4 ♀ Astrakhan Region, Astrakhan State Biosphere Reserve, Damchiksky branch, bank of the river, Bystraya stream, 25–29.06.2014 (Lopyreva, Anokhin); 98 ♂, 114 ♀, Obzhorovsky branch, river bank, Obzhorovo channel, 10–16.07.2014 (Lopyreva, Anokhin); 8 ♂, 2 ♀, Obzhorovsky branch, river bank, the Poldnevoe channel, 15.07.2014 (Lopyreva, Anokhin). This is a rare species, known from southwestern Europe. In Russia it was discovered only in the North Caucasus (Grichanov et al., 2006). This is the first record for the Astrakhan region.

The species **Dolichopus sabinus** Haliday, 1838 was noted by Lopyreva et al. (2014). It should be referred to the species **Dolichopus calinotus**. The latter differs from **Dolichopus sabinus** on the base of the hypopygium structure (Fig. 5).

**Dolichopus cilifemoratus** Macquart, 1827

Material. 125 ♂, 109 ♀, Damchiksky branch, Damchik settlement, 28.29.06.2014; Obzhorovsky branch, shore of the channel Poldnevoe, 10–16.06.2014 (Lopyreva, Anokhin). It is known from Western Europe, European Russia and Siberia. This is the first record for the Astrakhan region.
Dolichopus calinotus Macnutt, 1827  
**Material.** 2 ♂, Obzhorovsky branch, shore of the channel Poldnevoe, 11.07.2014 (Lopyreva, Anokhin). It is known from Western Europe and European Russia. This is the first record for the Astrakhan region.

Dolichopus jaxarticus Stackelberg, 1927  
**Material.** 28 ♂, 34 ♀, Damchiksky branch, Damchik settlement, 24–30.06, 03–07.07.2014; Obzhorov area, the shore of the Obzhorov channel, 10–16.07.2014 (Lopyreva, Anokhin). It is known from Central Asia, China and Ukraine. This is the first record for Russia.

Dolichopus zernyi Parent, 1927  
**Material.** 83 ♂, 153 ♀, Damchiksky branch, Damchik settlement, 24.06–02.07.2014 (Lopyreva, Anokhin). It was described from Sarepta (former Krasnoarmeysk, near Volgograd). The species is known from the south and middle belts of the Palaearctic, from Kazakhstan, China and Russia (Astrakhan region, Volgograd region, Voronezh region).

Hercostomus convergens (Loew, 1857)  
**Material.** 6 ♂, 7 ♀, Obzhorovsky branch, shore of the channel Poldnevoe, 10–16.07.2014 (Lopyreva, Anokhin). It is distributed in Central and Southern Europe, Western Asia. In Russia, it is known from Krasnodarsky Krai and Voronezh region. This is the first record for the Astrakhan region.

Hercostomus rubroviae Nagrobov, 1977  
**Material.** 1 ♂, 2 ♀, Damchiksky branch, 2nd cordon, 1–2.07.2014 (Lopyreva, Anokhin). It is known from Uzbekistan and Mongolia. This is the first record for Europe and Russia.

Medetera diadema (Linnaeus, 1767)  
**Material.** 6 ♂, 8 ♀, Damchiksky branch, the banks of the middle River Bystraya, 24.06.2014, 03–06.07.2014 (Lopyreva, Anokhin). This is the first record for the Astrakhan region.

Medetera plumbea Meigen, 1824  
**Material.** 1 ♀, Trekhizbinsky branch, Trekhizbinka, 06.07.2017 (Bykovsky). This is the first record for the Astrakhan region.

Nematoproctus longifilus Loew, 1857  
**Material.** 9 ♂, 11 ♀, Damchiksky branch, village Damchik, bank of the Bystraya river, 02.07.2014, Obzhorovsky branch, shores of the channel Poldnevoe, 15.07.2014 (Lopyreva, Anokhin). It is known from Western Europe and Russia (only in the Voronezh region). This is the first record for the Astrakhan region.

Poecilobothrus bigoti Mik, 1883  
**Material.** 8 ♂, 1 ♀, Damchiksky branch, 02.07.2014, Obzhorovsky branch, shores of the channel Poldnevoe, 15–16.07.2014 (Lopyreva, Anokhin). It is known from Central and Southern Europe, Iran and Russia – in the Moscow region, Voronezh region, and the North Caucasus.

Rhaphium antennatum (Carliter, 1835)  
**Material.** 6 ♂, 2 ♀, Damchiksky branch, village Damchik, 29–30.06.2014 (Lopyreva, Anokhin). It is known from Central and Southern Europe, Iran and Russia – in the Leningrad region, Voronezh region, Krasnoyarsky Krai, in the North Caucasus. This is the first record for Russia.

Rhaphium penicillatum Loew, 1850  
**Material.** 1 ♂, Obzhorovsky branch, shore of the channel Poldnevoe, 11.07.2014 (Lopyreva, Anokhin). It is known from Iran, Europe and Russia – from the Leningrad region, Voronezh region, Krasnoyarsky Krai, in the North Caucasus. This is the first record for the Astrakhan region.

Sciapus longulus (Fallen, 1823)  
**Material.** 57 ♂, 26 ♀, Damchiksky branch, bank of the River Bystraya, 24–25.06.2014, Obzhorovsky branch, shores of the channel Poldnevoe, 10–15.07.2014 (Lopyreva, Anokhin). This is the first record for the Astrakhan region.

Sciapus subvicinus Griechanov, 2007  
**Material.** 2 ♂, 11 ♀, Damchiksky branch, bank of the River Bystraya, 02.07.2014; Obzhorovsky branch, shore of the channel Poldnevoe, 15–16.07.2014 (Lopyreva, Anokhin). It is described from the south of Ukraine, listed for the fauna of Armenia, Kazakhstan and Uzbekistan. This is the first record for Russia.

This work provides data on four species new for both Europe and Russia: Asyndetus albipalpus, Asyndetus chaetifemoratus, Chrysotus dorli, and Hercostomus rubroviae. In addition, Sciapus subvicinus and Dolichopus jaxarticus are new species for Russia.
Thus, 23 species from the Dolichopodidae family were found in the Astrakhan State Nature Biosphere Reserve. Twenty of these species are recorded for the first time for the Astrakhan region. In total, to date 34 species from the family Dolichopodidae are known from the Astrakhan region taking into account previously known species.

The studies of Dolichopodidae species of Protected Areas are extremely inadequate, being represented by separate regional faunistic lists. The most complete species list of this taxonomic group is published for the Caucasus State Natural Biosphere Reserve, which contains 151 species, including 25 endemics for the Caucasus and the endemic genus Guzeriplia Negrobov, 1968 (Negrobov, 1967, 1968, Negrobov & Shamshev, 1984; Negrobov & Selivanova, 2005; Grichanov et al., 2006).

The first record of the genus Nepalomysia Hollis for the Western Palearctic has been revealed from the Teberda State Nature Biosphere Reserve (Negrobov et al., 2018).

From the Prioksko-Terrasny Nature Biosphere Reserve, 20 species of the Dolichopodidae family are known (Tamarina et al., 1984). There are five species in the territory of Wrangel Island Nature Reserve (Grichanov & Khruleva, 2018). Twenty species are indicated for the Tigirekskii State Nature Reserve (Grichanov, 2017). Twenty-nine species are known from the Utrish State Nature Reserve (Kustov et al., 2016). Finally, 25 species are noted from the West Kotlin State Nature Reserve (Grichanov & Ovsyannikova, 2017).

Thus, there are numerous and scattered data on the Dolichopodidae family from many regions of Russia. Therefore, further studies, including field inventories, critical reviews, are needed for revealing data on distribution, ecology, taxonomy of the Dolichopodidae family in Russia and Eurasia as a whole.

Acknowledgments

The authors are grateful to Kirill V. Litvinov (Deputy Director for Science of the Astrakhan State Nature Biosphere Reserve, Russia) for help and advice, and to the officers of the Astrakhan Reserve for providing the Protected Area scheme and description of the vegetation in the studied habitats of the collected species. The authors are grateful to Igor Ya. Grichanov (All-Russian Institute of Plant Protection, Russia) for comments on the manuscript.

С учетом литературных данных к настоящему времени для Астраханской области известно 34 вида из семейства Dolichopodidae. Тем не менее необходимы дальнейшие исследования фауны семейства Dolichopodidae на особо охраняемых природных территориях для получения более полных сведений об этом семействе двукрылых в России и в Евразии в целом.

Ключевые слова: Астраханская область, муки-зеленушки, насекомые, новое местонахождение, особо охраняемая природная территория
