**ABSTRACT**

Extreme environments, such as subterranean habitats, are suspected to be responsible for morphologically inseparable cryptic or sibling species and can bias biodiversity assessment. A DNA barcode is a short, standardized DNA sequence used for taxonomic purposes and has the potential to lessen the challenges presented by a biotic inventory. Here, we investigate the diversity of the genus *Leptonetela* Kratochvíl, 1978 that is endemic to karst systems in Eurasia using DNA barcoding. We analyzed six hundred and twenty four specimens using one mitochondrial gene fragment (COI). The results show that DNA barcoding is an efficient and rapid species identification method in this genus. It indicated the existence of 90 species, a result consistent with previous taxonomic hypotheses and supported the existence of extreme male pedipalpal tibial spine and median apophysis polymorphism in *Leptonetela* species, with direct implications for the taxonomy of the group and its diversity, using DNA barcoding gap and automatic barcode gap discovery (ABGD) analyses. Based on the molecular and morphological evidence, we delimit and diagnose 90 *Leptonetela* species, including the type species *Leptonetela kanellisi* (Deeleman-Reinhold, 1971); 46 of them are previously undescribed species. *Leptonetela tianxinensis* (Tong & Li, 2008) comb. nov. is transferred from the genus *Leptoneta* Simon, 1872; The genus *Guineta* Lin & Li, 2010 syn. nov. is junior synonym of *Leptonetela*, *Leptonetela gigachela* (Lin & Li, 2010) comb. nov. is transferred from genus *Guineta*. The genus *Sinoneta* Lin & Li, 2010 syn. nov. is junior synonym of *Leptonetela*, *Leptonetela notabilis* (Lin & Li, 2010) comb. nov., *Leptonetela sexdigi* (Lin & Li, 2010) comb. nov. are transferred from genus *Sinoneta*, *Leptonetela sancheh* nom. nov. is proposed as replace name for *Sinoneta palmata* (Chen et al., 2010) because *Leptonetela palmata* is a preoccupied name.

**Keywords:** DNA barcoding; Phylogeny; Phenotype; Species delineation

**INTRODUCTION**

Subterranean ecosystems, such as caves and cracks, are evident mainly in karst areas, which represent nearly 4% of the rocky outcrops of the world. These environments are marked by permanent darkness, a lack of diurnal and annual rhythms, and extremely scarce food sources (Culver & White, 2005; Howarth, 1983; Poulson & White, 1969). Many studies show that despite stressful and unfavorable conditions, the subsurface habitat harbors diverse animal communities (mainly invertebrates) (Amara-Zettler et al., 2002; Flot et al., 2010; López-García et al., 2001; Mathieu et al., 1997; Niemiller et al., 2012; Sket, 1999). Troglobionts are expected to adopt strategies that are characterized by significant geographic isolation and numerous local endemics (Convey, 1997; Waterman, 2001). Because the diversity of possible adaptive responses decline with stress intensity (Nevo, 2001), evolution in harsh environments is also expected to be influenced by convergence (Little & Vrijenhoek, 2003; Rothschild & Mancinelli, 2001; Waterman, 2001). Therefore, in subterranean and more generally in extreme environments, diversification and speciation processes should be largely influenced by island-like habitats, such as caves, allopatric speciation and vicariant events, and could be masked by morphological convergence. For these groups of organisms,
morphism alone cannot determine species boundaries. So identifying morphologically inseparable cryptic or sibling species requires an integrative approach with a set of taxonomic tools, including DNA analysis.

DNA barcoding relies on the use of a standardized DNA region as a tag for accurate and rapid species identification (Hebert & Gregory, 2005) and has been advanced to help overcome the "taxonomic impediment" (Herbert et al., 2003a; Tautz et al., 2003). It aids in the identification of species in applied settings, the association of morphologically distinct life-cycle forms within a species, the detection of host-specific lineages and the detection of morphologically cryptic species (Miller & Foottit, 2009). DNA barcoding has been used in a diverse range of vertebrate and invertebrate taxa (Clare et al., 2007; Ratnasingham & Hebert, 2007) and has enabled an increasing number of taxa to be identified. For example, a survey of crustacean stygofauna suggests that there could be substantial levels of subterranean biodiversity hidden in Australia’s aquifer (Asmyhr & Cooper, 2012). Nevertheless, the exclusive use of single-locus molecular gene fragments is not without risks, for identical mitochondrial DNA sequences can be present in unrelated species due to introgression, or incomplete lineage sorting (Ballard & Whitlock, 2004). Additionally, the use of a divergence threshold for distinguishing intra- versus interspecific sequence variation (Hebert et al., 2003a) can seriously compromise species identification and suffers from severe statistical problems (Vences et al., 2005). Furthermore, species misidentification has been observed when a reference database is not comprehensive; such that is does not contain all the species of the group under study (Meyer & Paulay, 2005).

The South China karst, a UNESCO World Heritage Site since 2007, is noted for its karst features and landscapes as well as rich biodiversity. Numerous subterranean species have been reported in this region, especially invertebrate fauna (Zhang, 1986). The spider genus *Leptonetela* is discontinuously distributed in the South China karst and the Balkan Peninsula, a karstic region in Europe. The genus has 54 catalogued species (World Spider Catalog, 2017), and with one exception (*L. pungitii* Wang & Li, 2011), nearly all *Leptonetela* species are endemic to either a single cave or a cave system. The spiders are cave adapted and show morphological features, such as vestigial eyes and highly reduced skin pigmentation. Over the past 9 years, we have conducted extensive surveys of subterranean biodiversity in Eurasia. More than 1,500 caves were visited, and we ultimately sampled 122 *Leptonetela* populations (caves). Rapid and accurate identification within this genus is difficult due to congeneric species sharing similar morphological traits, a lack of obvious morphological differences between closely related species and some species only differ in some quantity difference, such as the location, length ratio or thickness of the male pedipalpal tibia spines and the number of teeth on the median apophysis.

In this study, we test the usefulness of DNA barcoding for species identification in the subterranean genus *Leptonetela* and investigate the diversity of the genus. The standard molecular barcode, cytochrome c oxidase subunit I (COI) was used. A species discovery method, automatic barcode gap discovery (ABGD) (Puillandre et al., 2012), and a species validation method, DNA barcoding gap analysis, (Hebert et al., 2003b) were both used, depending on whether the samples were partitioned prior to analysis. The main goals of our study were: (i) to test whether the COI barcoding fragment can reliably resolve and identify subterranean *Leptonetela* species by comparing the COI barcode fragment results with those from morphological data; (ii) to test taxonomic value of morphological characters used in traditional methods of classification.

**MATERIALS AND METHODS**

**Taxon sampling**

We sampled 624 *Leptonetela* individuals from 122 populations (caves) (Table S1) in Eurasia (Insular and Peninsular Greece, and Southeast Asia; see inset in Fig. 1). Nine individuals from three other genera of the family *Leptonetididae* were chosen as the out-group. All specimens were collected alive, fixed in absolute ethanol, and the legs were removed for subsequent DNA extraction. Voucher specimens and all type specimens were deposited in the National Zoological Museum, Chinese Academy of Sciences (IZCAS), Beijing, China.

**Molecular protocols**

Total genomic DNA was extracted using the Animal Genomic DNA Isolation Kit (Dingguo, Beijing, China), following the manufacturer’s protocol. We amplified the cytochrome c oxidase subunit I (COI) barcode region using the primer pairs LCOI490/HCO2198 (Folmer et al., 1994). PCR reaction conditions were: initial denaturation at 94 °C for 1 min; 35 cycles of denaturation at 94 °C for 1 min, annealing at 45 °C for 45 s, and elongation at 70 °C for 60 s; and final extension at 72 °C for 5 min. The 25-μL PCR reactions included 17.25 μL of double-distilled H₂O, 2.5 μL of 10× Taq buffer (mixed with MgCl₂; TianGen Biotech, Beijing, China), 2.0 μL of dNTP Mix (2.5 mM), 1 μL of each forward and reverse 10-μM primer, 1 μL of DNA template, and 0.25 μL Taq DNA polymerase (2.5 U μL⁻¹; TianGen Biotech, Beijing, China). Double-stranded PCR products were visualized by agarose gel electrophoresis (1% agarose). PCR products were purified and sequenced by Sunny Biotechnology Co., Ltd (Shanghai, China) using the ABI 3730XL DNA analyser. Sequences were aligned using ClustalW in Mega 6.0 (Tamura et al., 2013), with visual inspection, translation, and manual adjustment to minimize alignment error. The most appropriate phylogenetic model for the sequence alignment was selected using jModelTest2 (Darriba et al., 2012) under the Akaike Information Criterion (Posada & Crandall, 1998).

**Phylogenetic analyses**

Phylogenetic analyses were performed using maximum likelihood (ML) in RAXML v. 7.0.3 and the GTRCAT model (Stamatakis, 2006). One hundred replicate ML inferences were performed in the search for an optimal ML tree, each initiated with a random starting tree and employing the default rapid hill-climbing algorithm. Clade confidence was assessed with a rapid bootstrap of 1,000 replicates.
FIGURE 1  Area of endemic of *Leptonetela*

Species delineation
We analyzed the COI barcode dataset (see Appendix S1) using two species delineation methods. DNA barcoding gap analyses require an *a priori* species designation. Therefore, we divided the 624 *Leptonetela* individuals of 122 populations (caves) into 90 putative species based on morphological characters and geographic information. In our DNA barcoding gap analysis, we examined the overlap between the mean intraspecific and interspecific Kimura 2-parameter (K2P) (Kimura, 1980) and uncorrected p-distance (Nei & Kumar, 2000) for each candidate species, as calculated by Mega v. 6.0 (Tamura et al., 2013).

The automatic barcode gap discovery procedure (ABGD) (Puillandre et al., 2012), which does not require assigning samples to putative species, calculates all pairwise distances in the dataset, evaluates intraspecific divergences, and then sorts the samples into candidate species using the calculated distances. We performed ABGD analyses online (http://wwwabi.snv.jussieu.fr/public/abgd/), using three different distance metrics: Jukes-Cantor (JC69) (Jukes & Cantor, 1969), Kimura 2-parameter (K2P) (Kimura, 1980), and simple distance (p-distance) (Nei & Kumar, 2000). We analyzed the data using two different values for the parameters Pmin (0.0001 and 0.001), Pmax (0.1 and 0.2), and relative gap width (X = 1 or 1.5), with all other parameters at default values.

Taxonomy
The terminology and the measurements in this paper generally follow Wang & Li (2011) and Ledford et al. (2011). All measurements were taken in millimetre (mm). The left palpi of male spiders are illustrated, except where otherwise indicated. Abbreviations used in text include: PL – prolateral lobe; E – embolus; C – conductor; MA – median apophysis; At – atrium; SS – spermathecae stalk; SH – spermathecae.

Nomenclatural acts
This article conforms to the requirements of the amended International Code of Zoological Nomenclature. All nomenclatural acts contained within this published work have been registered in ZooBank. The ZooBank LSIDs (Life Science Identifiers) can be resolved and the associated information viewed by appending the LSID to the prefix “http://zoobank.org/”. The LSID for this publication is: urn:lsid:zoobank.org:pub:7ECB1BDC-8893-4D0F-8BEA-17ECE327FC47

RESULTS
In total, 624 DNA barcodes were analyzed. A full list of the analyzed specimens can be found in the supporting information (S1 Table). Fragment lengths of the analyzed DNA barcodes ranged from 107 (0.005%) to 617bp (89%). For all populations, except *L. kanellisi* and *L. robustispina*, four or more DNA barcodes have been generated. All nucleotides were translated into functional protein sequences in the correct reading frame, with no stop codons or indels observed in the data. Similar to other arthropod studies, our data indicated a high AT-content for this mitochondrial gene fragment: the mean sequence compositions were A=20.5%, C=12.6%, G=24.4, T= 41.4%.

Phylogenetic inference
The ML gene tree topology suggests that *Leptonetela* is monophyletic, with the node highly supported (Fig. 2; bootstrap value, BS = 92). Our analyses revealed all *Leptonetela* species
formed non-overlapping clusters, with bootstrap support value of 100. In contrast, relationships among putative species were largely unresolved, usually with low bootstrap support on the ML gene tree, particularly at deeper phylogenetic levels.

FIGURE 2  Maximum likelihood COI gene tree for 624 terminals of Leptonetela, with the results of two different species delimitation approaches (see legend).
Numbers near branches show bootstrap supports (>74). Species names and locality group terminals according to consensus results of species delimitation approaches.
FIGURE 2  Continued
Species delineation
DNA barcoding gap analysis: Based on our a priori species hypotheses, interaspecific divergences ranged from zero to 5.3%/5.0% (K2P/uncorrected p-distance) whereas interspecific distances were between 3.1%/3% and 31.9%/25% (K2P/uncorrected p-distance). Maximum intraspecific distances >3% were found for 2 species, including *L. reticulopecta* (4.3%/4.0%), and *L. pentakis* Lin & Li, 2010 (5.3%/5%). The lowest interspecific distance were revealed for the 2 species pairs *L. changtu* Wang & Li sp. nov. with *L. chuan* Wang & Li sp. nov. and *L. kansga* Wang & Li sp. nov. with *L. shibingensis* Guo, Yu & Chen, 2016 with a value of 3.1%/3%. Minimum interspecific pairwise distances <5%, and >3% were found for 2 species pairs: *L. shibingensis* with *L. shanji* Wang & Li sp. nov. and *L. dao* Wang & Li sp. nov. with *L. xiaoyan* Wang & Li sp. nov. The mean interspecific distance between the 90 tentative species was 17.9/15.6% (K2P/uncorrected p-distance), and the mean intraspecific distance within each species was 0.2% (both K2P and uncorrected p-distance) in *Leptonetela*. A histogram of the gap and overlap between intra- and interspecies genetic distances are show in Figure 3.

ABGD analysis
The ABGD analyses of the COI dataset, using the originally specified parameter combinations and partitions resulted mostly in 90 distinct species, which correspond to the 90 species observed in the previous taxonomic hypotheses based on morphological identification. The result was the same regardless of the model of evolution employed (Jukes-Cantor (JC), K2P, Simple Distance). The settings Pmin/Pmax = 0.0001/0.2 yielded the most significant P values. However, at lower values of prior intraspecific distance
recursive partition of ABGD recognized more species (Table 1), when \( \text{P}_{\text{min}}/\text{P}_{\text{max}} = 0.0001/0.2 \), \( \text{P} \) values =0.159, JC and K2P distance resulted in 98 species, and resulted in 95 species in Simple distance.

**DISCUSSION**

DNA barcoding is widely recognized as a useful tool for species identification across the animal kingdom (Chesters et al., 2012; Wang et al., 2011). Our research represents an important step towards the application of DNA barcodes for identification of *Leptonetela* taxa. For 119 taxa (97%), our sequence data represent the first published DNA barcodes.

Classically, geographic isolation is considered a primary feature of troglobitic taxa (Hedin, 1997; Hedin & Thomas, 2010). Our DNA barcoding result is consistent with this view. And similar to other DNA barcoding studies, in which COI showed high genetic structure between populations within species (Tavares et al., 2001). Our results showed high robustness with geographical genetic structure for COI, such as specimens in one cave or from closely associated cave systems formed a well supported cluster.

Choosing appropriate thresholds that can delimit species is one of the main challenges and concerns for DNA barcoding researches (Ferguson, 2002). Our DNA barcoding gap analysis shows an overlap in the range of intra- and interspecific COI sequence divergences. The interspecific genetic divergences between *L. chuan* Wang & Li sp. nov. and *L. changtu* Wang & Li sp. nov., *L. kangsa* Wang & Li sp. nov. and *L. shibingensis*, as well as between *L. shibingensis* and *L. shanjil* Wang & Li sp. nov.

was 3.1%/3.0% based on K2P/uncorrected and p-distance models. Compared with other species L. chuan Wang & Li sp. nov., L. changtu Wang & Li sp. nov., L. kangsa Wang & Li sp. nov., L. shibingensis and L. shanji Wang & Li sp. nov. are more closely distributed. In morphology, L. chuan Wang & Li sp. nov. and L. changtu Wang & Li sp. nov. can be distinguished by the shape of the median apophysis and the conductor (median apophysis palm-shaped, edge decorated with sclerotized spots, conductor semicircular in L. changtu Wang & Li sp. nov.; median apophysis rectangular, with 5 larger teeth distally, conductor triangular in ventral view in L. chuan Wang & Li sp. nov.); L. kangsa Wang & Li sp. nov., L. shibingensis and L. shanji Wang & Li sp. nov. can be distinguished by the location and shape pattern of male pedipalpal tibial spines (I spine located at the middle in L. shibingensis and L. shanji Wang & Li sp. nov.; I spine asymmetrically bifurcated in L. shanji Wang & Li sp. nov., male pedipalpal tibial I spine located at base and not bifurcated in L. kangsa Wang & Li sp. nov.). Nevertheless, we found two species with maximum pairwise distance >3%, including L. reticulopecta (specimens from Tianshegnqiao cave is clearly distant from the rest) with 4.3%/4.0%, L. pentakis (specimens from Liaoya cave is clearly distant from the rest) with 5.3%/5.0%. Then we achieved a threshold of 3.1%/3.0% (K2P/uncorrected and p-distance), excluding taxa from Tianshegnqiao cave and Liaoya cave. This threshold was interestingly close to the 3% commonly used in barcoding literature (Hebert et al., 2003a, b).

Here, we found a high identification success using ABGD. In ABGD analysis, the taxa from Tianshegnqiao cave and Liaoya cave were identified as L. reticulopecta and L. pentakis, respectively. Given the fact that all specimens of L. reticulopecta and L. pentakis are morphologically highly similar, we are currently unable to ascertain if the observed genetic distances simply represent a high level of interspecific variation or reflect cryptic distance between established new taxa. To answer this question, more specimens need to be collected and analyzed, using both morphological characters and nuclear sequence data.

In conclusion, our study demonstrates the power of an integrative approach, in which classical and DNA barcoding taxonomy complement each other and both contribute to a more accurate taxonomic classification.

- Pedipalpal tibial with 3 long spines prolaterally —— L. wuming Wang & Li sp. nov.
- Pedipalpal tibial with 1 or 2 long spines prolaterally —— L. lophacantha Guo, Yu & Chen, 2016

42 Pedipalpal tibial with 1 curved spine prolaterally, the retrolateral I spine longest, median apophysis triangular-shaped —— L. xianren Wang & Li sp. nov.
- Pedipalpal tibial I spine longest, the rest concentrated at distal end of tibia, median apophysis mountain-shaped in ventral view —— L. rudicula Wang & Li, 2011
- Pedipalpal tibial I spine longest, I, II, and III spines strong, with the same degree in strong, median apophysis "M" shaped in ventral view —— L. longli Wang & Li sp. nov.
- Pedipalpal tibial with 1 long spine prolaterally, median apophysis tongue-shaped, conductor triangular —— L. pungilia Wang & Li, 2011
- Pedipalpal tibial with 2 long spines prolaterally —— L. chiosensis Wang & Li, 2011
- Pedipalpal tibial I spine strongest, III-V spines in a triangular arrangement, median apophysis punctate, conductor triangular —— L. xinhua Wang & Li sp. nov.
- Pedipalpal tibial I spine longest, spine I-III with the same degree in strong, IV-V situated distally median apophysis m"shaped, conductor triangular shaped —— L. feilong Wang & Li sp. nov.
- Pedipalpal tibial with 6 spines retrolaterally, I spine close to others, median apophysis flake-like, sclerotized distally, conductor broad, wavy line-shaped distally —— L. tiankeng Wang & Li sp. nov.
- Pedipalpal tibial with 7 spines retrolaterally, I spine distante from others, median apophysis small worm-shaped, conductor thin, triangular —— L. lophacantha (Chen, Jia & Wang, 2010)

50 Median apophysis index finger like —— L. xinhua Wang & Li sp. nov.
- Median apophysis harrow-like —— L. wuming Wang & Li sp. nov.
- Embolus bifurcated —— L. xinhua Wang & Li sp. nov.
- Embolus not bifurcated —— L. shibingensis Guo, Yu & Chen, 2016

51 Male pedipalp tibia with 5 spines retrolaterally —— L. parlonga Wang & Li, 2011
- Male pedipalp tibia with 6 slender spines retrolaterally, I spine longest, conductor smooth, semicircular —— L. xinhua Wang & Li sp. nov.

54 Pedipalpal tibial I spine much stronger than II, asymmetrically bifurcated —— L. jinsha Lin & Li, 2010
- Pedipalpal tibial I spine similarly strong as II, not bifurcated —— L. xinhua Wang & Li sp. nov.

55 Cymbium constricted distally, earlobe-shaped process with 2 long curved spines retrolaterally, base of median apophysis distinctly swollen, conductor smooth, broad, semicircular —— L. gubin Wang & Li sp. nov.
- Cymbium not constricted distally, earlobe-shaped process small, base of median apophysis slightly swollen, conductor rugose, thin, triangular —— L. lujia Wang & Li sp. nov.
- Male pedipalp tibia with 6 spines retrolaterally —— L. xinhua Wang & Li sp. nov.
- Male Pedipalp tibia with 5 spines retrolaterally —— L. wuming Wang & Li sp. nov.
- Median apophysis not bifurcated distally —— L. xinhua Wang & Li sp. nov.

57 Pedipalpal tibial I spine located at the base of tibia —— L. xinhua Wang & Li sp. nov.
- Pedipalpal tibial I spine located medially —— L. xinhua Wang & Li sp. nov.
- Pedipalpal tibial I spine asymmetrically bifurcated, tibia with 4 long spines prolaterally —— L. xinhua Wang & Li sp. nov.
- Pedipalpal tibial I spine not bifurcated —— L. xinhua Wang & Li sp. nov.

58 Pedipalpal tibial I spine located at the base of tibia —— L. xinhua Wang & Li sp. nov.
- Pedipalpal tibial I spine located medially —— L. xinhua Wang & Li sp. nov.

59 Pedipalpal tibial I spine asymmetrically bifurcated, tibia with 4 long spines prolaterally —— L. xinhua Wang & Li sp. nov.
- Pedipalpal tibial I spine not bifurcated —— L. xinhua Wang & Li sp. nov.

60 Pedipalpal tibial with 4 spines prolaterally, cymbium with 1 curved spine at the basal of retrolateral surface, median apophysis weakly sclerotized —— L. xinhua Wang & Li sp. nov.
- Not as above —— L. xinhua Wang & Li sp. nov.

61 Male Pedipalp tibia with 2 spines prolaterally, conductor short, broad and rugose —— L. oktocantha Lin & Li, 2010
- Male Pedipalp tibia without spine prolaterally, conductor smooth, semicircular —— L. hexacantha Lin & Li, 2010
- Male Pedipalp tibia with 5 spines retrolaterally —— L. xinhua Wang & Li sp. nov.
- Male Pedipalp tibia with 6 spines retrolaterally —— L. xinhua Wang & Li sp. nov.
- Male Pedipalp tibia with 7 spines retrolaterally, I spine distante from others, median apophysis small worm-shaped, conductor thin, triangular —— L. lophacantha (Chen, Jia & Wang, 2010)

62 Median apophysis curved distally —— L. xinhua Wang & Li sp. nov.
- Median apophysis not curved distally —— L. xinhua Wang & Li sp. nov.

63 Cymbium with 1 ox horn-shaped spine on the earlobe-shaped process retrolaterally, tibia spines gradually shorted, conductor smooth, C tile-shaped —— L. mengzongensis Wang & Li, 2011
- Cymbium without spine on the earlobe-shaped process retrolaterally .................................................... 64
- Male Pedipalp tibia with 2 long setae prolaterally, tibial I II and III spines equally in length, conductor broad, semicircular ...................................................................................................................... L. hamata Lin & Li, 2010

- Pedipalpal tibial I spine bifurcate ....................................................... 92

---

**Family Leptonetidae Simon, 1890**

**Genus Leptonetela Kratovchv, 1978**

**Type species:** *Leptonetela kanellisi* (Deeleman-Reinhold, 1971) from Greece.

**Diagnosis.** The genus *Leptonetela* can be distinguished from other leptonetid genera by the following combination of male pedipalpal characters: femur spineless and tibia with a longitudinal row of spines on the retrolateral surface.

**Redescription.** Carapace yellowish or white. Sternum shield. Opisthosoma gray, ovoid, covered with short hairs. Male pedipalpal patella with one short spine dorso-distally; tibia with trichobothria dorsally; cymbium with strong, thorny spine distally; bulb yellowish, ovoid, with two appendages inserted ventrally, median apophysis chitinous, conductor membranous, median apophysis and conductor absent in some species, embolus transparent, membranous. Female genital area covered with short hairs. Vulva with a pair of spermathecae and sperm ducts, spermathecae twisted and weakly sclerotized.

**Distribution.** Greece, Turkey, Georgia, Azerbaijan, Vietnam and China.

**Leptonetela chakou Wang & Li sp. nov.**

Figs 4–5, 97

**Type material.** Holotype: male (IZCAS), Chakou Cave, 27.93°N, 106.14°E, Shalang, Shibao Town, Gulin County, Luzhou City, Sichuan Province, China, 20 April 2014, Y. Li, H. Zhao & Y. Lin leg. Paratypes: 1 male and 3 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. dao* Wang & Li sp. nov., *L. grandispina* Lin & Li, 2010, *L. liuzhai* Wang & Li sp. nov., *L. pentakis* Lin & Li, 2010, and *L. shuilian* Wang & Li sp. nov., but can be distinguished by the male pedipalpal tibia with 5 spines retrolaterally, the basal spine strong, conspicuous and with a bifurcate tip (Fig. 4D) (6 short spines, with spine II largest in *L. grandispina*, 5 slender spines in *L. dao* Wang & Li sp. nov., *L. liuzhai* Wang & Li sp. nov., *L. pentakis* and *L. shuilian* & Li sp. nov.); the median apophysis divided into 4 pine needle like structures (Fig. 4B) (median apophysis divided into 2 pine needle like structures a in *L. dao* Wang & Li sp. nov. and *L. shuilian* Wang & Li sp. nov., 15 pine needle like structures in *L. liuzhai* Wang & Li sp. nov., and 5 pine needle like structures in *L. pentakis*); from *L. dao* Wang & Li sp. nov., *L. grandispina*, *L. pentakis* by the conductor reduced in this new species (Fig. 1B); from *L. liuzhai* Wang & Li sp. nov. by the cymbium 1.3 times longer than bulb (Figs 4C–D) (cymbium 2 times longer than bulb in *L. liuzhai* Wang & Li sp. nov. and *L. shuilian* & Li sp. nov.).

**Description.** Male (holotype). Total length 2.25 (Fig. 4A). Carapace 0.87 long, 0.87 wide. Opisthosoma 1.50 long, 1.00 wide. Carapace brown. Eyes six. Median groove, corvicel grooves and radial furrows distinct. Clypeus 0.13 high. Opisthosoma gray, ovoid, with pigmented stripe. Leg measurements: I 7.63 (2.05, 0.35, 2.35, 1.75, 1.13); II 5.71 (1.63, 0.30, 1.60, 1.30, 0.88); III 4.73 (1.25, 0.30, 1.13, 1.20, 0.85); IV 6.30 (1.75, 0.35, 1.75, 1.45, 1.00). Male pedipalp (Figs 4C–D): tibia with 2 large spines prolaterally, and 5 spines retrolaterally, I spine strong,

conspicuous, tip bifurcated. Cymbium constricted medially, attaching an earlobe-shaped process. Embolus triangular, bearing a basal tooth. Median apophysis sclerotized, divided into 4 pine needle like structures. Conductor membranous, reduced (Fig. 4B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 2.27 (Figs 5A–B). Carapace 0.88 long, 0.80 wide. Oposthsoma 1.50 long, 1.25 wide. Clypeus 0.12 high. Leg measurements: I 5.83 (1.50, 0.35, 1.55, 1.38, 1.05); II 4.43 (1.13, 0.30, 1.25, 1.00, 0.75); III 3.62 (1.00, 0.25, 1.00, 0.75, 0.62); IV 4.96 (1.38, 0.35, 1.35, 1.13, 0.75). Vulva (Fig. 5C): spermathecae coiled, atrium reduced (Fig. 4B).

**Distribution.** China (Sichuan).

**Leptonetela dao** Wang & Li sp. nov.

**Figs 6–7, 97**

**Type material.** Holotype: male (IZCAS), Dao Cave, 27.19˚N, 105.06˚E, Shuanlong, Salaxi County, Bije City, Guizhou Province, China, 18 November 2011, H. Chen & Z. Zha leg.

**Paratypes:** 1 male and 20 females, same data as holotype; 5 males and 7 females, Shanlanqiao Cave, 28.28˚N, 106.04˚E, Shalanqiao, Qianyanqiao Town, Anshun City, Guizhou Province, 04 November 2011, H. Chen & Z. Zha leg.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. chakou* Wang & Li sp. nov., *L. grandispina* Lin & Li, 2010, *L. liuzhai* Wang & Li sp. nov., *L. pentakis* Lin & Li, 2010, and *L. shuilian* Wang & Li sp. nov., but can be separated from *L. chakou* Wang & Li sp. nov., *L. grandispina*, *L. liuzhai* Wang & Li sp. nov. and *L. pentakis* by median apophysis divided into 2 pine needle (Fig. 6B) (median apophysis divided into 4 pine needle like structures in *L. chakou* Wang & Li sp. nov. and *L. grandispina*, 15 pine needle like structures in *L. liuzhai* Wang & Li sp. nov. and 5 pine needle like structures in *L. pentakis*); from *L. chakou* Wang & Li sp. nov., *L. grandispina* by the tibial spines slender (Fig. 6D) (the tibial I spine in *L. chakou* Wang & Li sp. nov. and II spine in *L. grandispina* strongly); from *L. chakou* Wang & Li sp. nov., *L. pentakis* by the cymbium not constricted medially (Fig. 6C); from *L. liuzhai* Wang & Li sp. nov. and *L. shuilian* Wang & Li sp. nov. by the cymbium 1.2 times longer than bulb (Figs 6C–D) (cymbium 2 times longer than bulb in *L. liuzhai* Wang & Li sp. nov. and *L. shuilian* Wang & Li sp. nov.).

**Description.** **Male (holotype).** Total length 2.28 (Fig. 6A). Carapace 1.15 long, 1.03 wide. Oposthsoma 1.28 long, 0.93 wide. Carapace brown. Eyes six, reduced to white vestiges. Median groove, cervical grooves and radial furrows distinct. Clypeus 0.15 high. Oposthsoma gray, ovoid. Leg measurements: I 10.36 (2.76, 0.40, 3.24, 2.40, 1.56); II 8.72 (2.44, 0.43, 2.60, 1.72, 1.60); III 6.20 (2.04, 0.32, 1.52, 1.40, 0.92); IV 8.80 (2.56, 0.40, 2.60, 2.04, 1.20). Male pedipalp (Figs 6C–D): tibia with 5 slender spines prolaterally and 5 slender spines retrolaterally, with I spine longest. Cymbium not wrinkled, earlobe-shaped process small. Embolus triangular, prolateral lobe small, oval. Median apophysis sclerotized, divided into 2 pine needle like structures. Conductor broad, C tile-shaped in ventral view (Fig. 6B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with longer legs. Total length 2.76 (Figs 7A–B). Carapace 1.13 long, 1.10 wide. Oposthsoma 1.65 long, 1.40 wide. Clypeus 0.13 high. Leg measurements: I 11.36 (3.00, 0.40, 3.60, 2.60, 1.76); II 9.08 (2.64, 0.36, 2.80, 1.88, 1.40); III 7.44 (2.24, 0.36, 1.96, 1.64, 1.24); IV 9.89 (2.80, 0.40, 3.00, 2.08, 1.40). Vulva (Fig. 7C): spermathecae coiled, atrium triangular, anterior margin of the atrium with short hairs.

**Distribution.** China (Guizhou).

**Leptonetela liuzhai** Wang & Li sp. nov.

**Figs 8–9, 97**

**Type material.** Holotype: male (IZCAS), nameless Cave, 25.27˚N, 107.43˚E, Longli, Liuzhai Town, Nandan County, Hechi City, Guangxi Zhuang Autonomous Region, China, 29 January 2015, Y. Li & Z. Chen leg. **Paratypes:** 2 males and 6 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. chakou* Wang & Li sp. nov., *L. dao* Wang & Li sp. nov., *L. grandispina* Lin & Li, 2010, *L. pentakis* Lin & Li, 2010, and *L. shuilian* Wang & Li sp. nov. but can be separated from *L. chakou* Wang & Li sp. nov., *L. dao* Wang & Li sp. nov., *L. grandispina*, and *L. pentakis* by the male pedipalpal cymbium double the length of bulb, median apophysis divided into 15 pine needle like structures (Figs 8B) (cymbium not double the length of bulb in *L. chakou* Wang & Li sp. nov., *L. dao* Wang & Li sp. nov., *L. grandispina*, and *L. pentakis*; median apophysis with 4 pine needles in *L. chakou* Wang & Li sp. nov. and *L. grandispina*, 2 pine needles in *L. dao* Wang & Li sp. nov. and *L. shuilian* Wang & Li sp. nov., and 5 pine needles in *L. pentakis*); from *L. chakou* Wang & Li sp. nov., and *L. grandispina* by the tibial spines slender (Fig. 8D) (I tibial spine in *L. chakou* Wang & Li sp. nov. and II spine in *L. grandispina* strongly); from *L. chakou* Wang & Li sp. nov., and *L. pentakis* by the cymbium not constricted medially in this new species (Figs 8C–D).

**Description.** **Male (holotype).** Total length 2.25 (Fig. 8A). Carapace 1.00 long, 0.88 wide. Oposthsoma 1.35 long, 1.10 wide. Carapace yellowish. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, cervical grooves and radial furrows distinct. Clypeus 0.15 high. Oposthsoma gray, ovoid. Leg measurements: I 8.30 (2.25, 0.25, 2.35, 1.95, 1.50); II 6.68 (1.88, 0.25, 2.00, 1.55, 1.00); III 5.70 (1.63, 0.20, 1.62, 1.35, 0.90); IV 7.49 (2.13, 0.25, 2.13, 1.85, 1.13). Male pedipalp (Figs 8C–D): tibia with 5 long spines prolaterally and 5 spines...

retromerally, with I spine longest. Cymbium not wrinkled, earlobe-shaped process small, cymbium double the length of bulb. Embolus triangular, prolateral lobe reduced. Median apophysis sclerotized, divided into 15 pine needle like structures. Conductor reduced (Fig. 8B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 2.50 (Figs 9A–B). Carapace 1.50 long, 0.88 wide. Opisthosoma 1.13 long, 1.38 wide. Clypeus 0.13 high. Leg measurements: I 7.30 (2.00, 0.25, 2.25, 1.75, 1.05); II 5.51 (1.63, 0.20, 1.85, 1.25, 0.88); III 4.76 (1.38, 0.25, 1.25, 1.13, 0.75); IV 6.50 (1.87, 0.25, 1.88, 1.50, 1.00). Vulva (Fig. 9C): spermathecae coiled, atrium fusiform.

**Distribution.** China (Guangxi).

**Leptonetela shuiliang Wang & Li sp. nov.** Figs 10–11, 97

**Type material.** Holotype: male (IZCAS), Shuiliang Cave, 24.43°N, 106.79°E, Pingle, Fengshan County, Hechi City, Guangxi Zhuang Autonomous Region, China, 22 March 2015, Y. Li & Z. Chen leg. Paratypes: 6 males and 4 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. chakou* Wang & Li sp. nov., *L. dao* Wang & Li sp. nov., *L. grandispana* Lin & Li, 2010, *L. pentakis* Lin & Li, 2010, and *L. liuzhai* Wang & Li sp. nov. but can be separated from *L. chakou* Wang & Li sp. nov., *L. dao* Wang & Li sp. nov., *L. grandispana* Lin & Li, 2010, *L. pentakis* Lin & Li, 2010 by the male pedipalpal cymbium double the length of bulb; from *L. chakou* Wang & Li sp. nov., *L. grandispana*, *L. liuzhai* Wang & Li sp. nov. and *L. pentakis* by the median apophysis divided into 2 pine needle like structures in *L. chakou* Wang & Li sp. nov. (Fig. 10B) (median apophysis divided into 4 pine needle like structures in *L. chakou* Wang & Li sp. nov. and *L. grandispana*, 15 pine needle like structures in *L. liuzhai* Wang & Li sp. nov., and 5 pine needle like structures in *L. pentakis*); from *L. chakou* Wang & Li sp. nov., *L. grandispana* by the tibial spines slender (Fig. 10D) (tibial spine in *L. chakou* Wang & Li sp. nov. and II spine in *L. grandispana* strong); from *L. chakou* Wang & Li sp. nov. and *L. pentakis* by the cymbium not constricted medially in this new species.

**Description.** Male (holotype). Total length 2.25 (Fig. 10A). Carapace 1.13 long, 1.00 wide. Opisthosoma 1.25 long, 0.90 wide. Carapace yellow. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.12 high. Opisthosoma gray, ovoid. Leg measurements: I (2.36, 2.88, 2.35, 1.60); II (2.13, 2.25, 2.00, 1.10); III (1.88, 1.75, 1.50, 0.95); IV (2.38, 2.38, 2.10, 1.25). Male pedipalp (Figs 10C–D): tibia with 3 long spines prolaterally, and 5 spines retrolaterally, with 1 spine longest, tip bifurcated. Cymbium not wrinkled, earlobe-shaped process absent, cymbium double the length of bulb. Embolus spoon-shaped; prolateral lobe reduced. Median apophysis sclerotized, divided into 2 sharp pine needle like structures. Conductor reduced (Fig. 10B).

**Female (one of the paratypes).** Similar to male in color and general features, but smaller and with shorter legs. Total length 2.10 (Figs 11A–B). Carapace 1.00 long, 0.85 wide. Opisthosoma 1.50 long, 1.13 wide. Clypeus 0.10 high. Leg measurements: I 7.30 (1.75, 0.35, 2.25, 1.70, 1.25); II 5.33 (1.40, 0.30, 1.63, 1.00, 1.00); III 5.01 (1.25, 0.25, 1.38, 1.25, 0.88); IV 6.48 (1.60, 0.30, 1.88, 1.60, 1.10). Vulva (Fig. 11C): spermathecae coiled, apical part free, atrium semicircular, anterior margin of the atrium with short hairs.

**Distribution.** China (Guangxi).

**Leptonetela chenjia Wang & Li sp. nov.** Figs 12–13, 97

**Type material.** Holotype: male (IZCAS), Chenjia Cave, 28.38°N, 108.67°E, Tianba, Songtao County, Tongren City, Guizhou Province, China, 9 Mar 2013, H. Zhao & J. Liu leg. Paratypes: 1 male and 2 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. anshun* Lin & Li, 2010, *L. suae* Lin & Li, 2010, *L. tongzi* Lin & Li, 2010, *L. liangfeng* Wang & Li sp. nov., and *L. sanyan* Wang & Li sp. nov., but can be distinguished by the male pedipalpal tibial I spine far apart from other 4 spines (Fig. 12D), conductor reduced (Fig. 12B) (I tibial spine bifurcated symmetrically in *L. anshun*, conductor tip bifurcate in *L. anshun*, bamboo leaf-shaped in *L. sanyan* Wang & Li sp. nov., and *L. tongzi*; thin, triangular in *L. suae* and *L. meitan*, and C tile-shaped in *L. liangfeng* Wang & Li sp. nov.); is also similar to *L. huoyan* Wang & Li sp. nov., but can be distinguished by the median apophysis absent, conductor reduced (Fig. 12B) (median apophysis present, slightly sclerotized, index finger like, conductor broad, semicircular in *L. huoyan* Wang & Li sp. nov.).

**Description.** Male (holotype). Total length 2.50 (Fig. 12A). Carapace 1.25 long, 0.95 wide. Opisthosoma 1.25 long, 0.88 wide. Carapace yellow. Ocular area with a pair of setae, six eyes. Median groove needle-shaped, cervical grooves and radial furrows distinct. Clypeus 0.15 high. Opisthosoma pale brown, ovoid, with pigmented stripe. Leg measurements: I 10.44 (2.60, 0.37, 3.05, 2.50, 1.62); II 7.84 (2.25, 0.35, 2.25, 1.87, 1.12); III 6.41 (1.50, 0.32, 1.87, 1.62, 1.10); IV 8.59 (2.50, 0.35, 2.37, 2.12, 1.25). Male pedipalp (Figs 12C–D): tibia with 3 long spines prolaterally, 5 spines retrolaterally, with 1 spine longest, far apart from others. Cymbium not wrinkled. Embolus triangular, prolateral lobe oval. Median apophysis absent. Conductor reduced (Fig. 12B).

FIGURE 13  Leptonetula chenjia sp. nov., one of paratype females
A: Habitus, dorsal view; B: Habitus, ventral view; C: Spermatheca, dorsal view.
Female (one of the paratypes). Similar to male in color and general features, but smaller and with shorter legs. Total length 2.25 (Figs 13A–B). Carapace 0.87 long, 0.80 wide. Opisthosoma 1.37 long, 1.12 wide. Clypeus 0.12 high. Leg measurements: I 7.89 (2.12, 0.37, 2.25, 1.85, 1.30); II 6.19 (1.62, 0.32, 1.75, 1.40, 1.10); III 5.10 (1.45, 0.30, 1.25, 1.20, 0.90); IV 6.76 (1.80, 0.35, 1.87, 1.62, 1.12). Vulva (Fig. 13C): spermathecae coiled, apical part coiled, atrium triangular.

Distribution. China (Guizhou).

Leptonetela liangfeng Wang & Li sp. nov. Figs 14–15, 97

Type material. Holotype: male (IZCAS), Liangfeng Cave, 28.32°N, 107.84°E, Tian, Lefeng Town, Wuchuan County, Zunyi City, Guizhou Province, China, 7 August 2012, H. Zhao leg.
Paratypes: 1 male and 2 females, same data as holotype.

Etymology. The specific name refers to the type locality; noun.

Description. Male (holotype). Total length 2.28 (Fig. 14A). Carapace 0.93 long, 0.88 wide. Opisthosoma 1.35 long, 0.88 wide. Carapace yellow. Eye absent. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma yellowish, ovoid. Leg measurements: I 9.47 (2.59, 0.43, 2.88, 2.25, 1.32); II 8.61 (2.23, 0.32, 2.60, 2.05, 1.41); III 7.38 (2.05, 0.43, 2.08, 1.55, 1.27); IV 8.81 (2.51, 0.38, 2.17, 2.28, 1.47). Male pedipalp (Figs 14C–D): tibia with 4 long setae prolaterally and 5 spines retrolaterally, I spine longest. Cymbium constricted medially, attaching an earlobe-shaped process. Embolus triangular, prolateral lobe absent. Median apophysis absent. Conductor C tile-shaped in ventral view (Fig. 14B).

Female (one of the paratypes). Similar to male in color and general features, but smaller and with shorter legs. Total length 2.14 (Figs 15A–B). Carapace 0.88 long, 0.73 wide. Opisthosoma 1.36 long, 0.95 wide. Clypeus 0.13 high. Leg measurements: I 7.44 (1.98, 0.38, 2.03, 1.77, 1.28); II 7.01 (1.88, 0.37, 1.98, 1.55, 1.23); III 5.78 (1.33, 0.25, 1.75, 1.42, 1.03); IV 7.59 (2.03, 0.33, 2.18, 1.79, 1.26). Vulva (Fig. 15C): spermathecae coiled, atrium triangular.

Distribution. China (Guizhou).

Leptonetela sanyan Wang & Li sp. nov. Figs 16–17, 97

Type material. Holotype: male (IZCAS), Sanyan Cave, 29.15°N, 107.60°E, Heyi, Yangxi Town, Dazhou County, Guizhou Province, China, 30 May 2011, Z. Zha leg.
Paratypes: 1 male and 2 females, same data as holotype.

Etymology. The specific name refers to the type locality; noun.

Description. Male (holotype). Total length 1.78 (Fig. 16A). Carapace 0.83 long, 0.83 wide. Opisthosoma 1.00 long, 0.75 wide. Carapace yellowish. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, pale brown. Cervical grooves and radial furrows indistinct. Clypeus 0.13 high, slightly sloped anteriorly. Opisthosoma yellow, ovoid, with pigmented stripe. Leg measurements: I 7.08 (2.00, 0.33, 2.15, 1.75, 1.15); II 6.09 (1.68, 0.30, 1.73, 1.38, 1.00); III 4.94 (1.38, 0.28, 1.25, 1.13, 0.80); IV 6.28 (1.75, 0.30, 1.78, 1.50, 0.95). Male pedipalp (Figs 16C–D): tibia with 1 long spine prolaterally, 5 spines retrolaterally, with the basal spine longest. Cymbium constricted medially, attaching an earlobe-shaped process. Embolus triangular, prolateral lobe absent. Median apophysis absent. Conductor bamboo leaf-shaped in ventral view (Fig. 13B).

Female (one of the paratypes). Similar to male in color and general features, but larger and with shorter legs. Total length 2.03 (Figs 17A–B). Carapace 0.80 long, 0.75 wide. Opisthosoma 1.25 long, 0.93 wide. Clypeus 0.13 high. Leg measurements: I 6.92 (1.88, 0.33, 2.00, 1.58, 1.13); II 5.36 (1.50, 0.30, 1.53, 1.15, 0.88); III 4.44 (1.20, 0.28, 1.13, 1.05, 0.78); IV 5.94 (1.73, 0.30, 1.58, 1.38, 0.95). Vulva (Fig. 17C): spermathecae coiled, atrium triangular, anterior margin of the atrium wavy line-shaped (Fig. 17C) (atrium fusiform, anterior margin of the atrium with mastoid process medially in L. tongzi).

Distribution. China (Guizhou).

Leptonetela wangi Wang & Li sp. nov. Figs 18–19, 94

Type material. Holotype: male (IZCAS), Wangjia Cave, 26.98°N, 107.94°E, Gaoqi, Nongchang Town, Huangpin County, Guizhou Province, China, 4 March 2012, H. Zhao & J. Liu leg.

Paratype: 1 female, same data as holotype.

FIGURE 19  *Leptonetela wangjia* sp. nov., one of paratype females
A: Habitus, dorsal view; B: Habitus, ventral view; C: Spermatheca, dorsal view.
**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. danxia* Lin & Li, 2010, and *L. yaoi* wang & Li, 2011, but can be distinguished by on the male pedipalpal bulb conductor reduced (Fig. 18B) (conductor C tile-shaped in *L. danxia*, bamboo leaf-shaped in *L. yaoi*), from *L. yaoi* by the tibial I spine slender, asymmetrically bifurcated (Fig. 18C) (tibial I spine strong in *L. yaoi*); from *L. danxia* by the cymbium not wrinkled (Figs 18C–D) (cymbium constricted and wrinkled at 1/3 in *L. danxia*).

**Description. Male (holotype).** Total length 2.13 (Fig. 18A). Carapace 0.88 long, 0.80 wide. Opisthosoma 1.00 long, 0.88 wide. Carapace yellow. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, cervical grooves and radial furrows distinct. Clypeus 0.13 high. Opisthosoma gray, ovoid. Leg measurements: I - (1.88, 0.25, - , - , - ); II 5.66 (1.63, 0.25, 1.63, 1.25, 0.90); III 4.71 (1.25, 0.23, 1.25, 1.13, 0.85); IV 6.25 (1.75, 0.25, 1.75, 1.50, 1.00). Male pedipalp (Figs 18C–D): tibia with 7 long setae prolaterally and 5 spines retrolaterally, I spine strong, tip curved. Cymbium not wrinkled, earlobe-shaped process absent. Embolus triangular, retrolateral lobe oval. Median apophysis absent. Conductor reduced (Fig. 18B).

**Female.** Similar to male in color and general features, but larger and with longer legs. Total length 2.50 (Figs 19A–B). Carapace 1.00 long, 0.90 wide. Clypeus 0.20 high. Leg measurements: I 9.26 (2.55, 0.38, 2.60, 2.10, 1.63); II 8.25 (2.37, 0.38, 2.25, 1.90, 1.35); III 6.90 (2.05, 0.35, 1.75, 1.65, 1.10); IV 7.86 (2.30, 0.38, 2.13, 1.75, 1.30). Vulva (Fig. 19C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Guizhou).

*Leptonetela langdong* Wang & Li sp. nov.

Figs 20–21, 94

**Type material.** Holotype: male (IZCAS), Menglonggong Cave, 27.07°N, 107.76°E, Langdong Village, Huangping County, Qiandongnan Prefecture, Guizhou Province, China, 3 March 2013, H. Zhao & J. Liu leg. **Paratypes:** 1 male and 2 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. furcasipina* Lin & Li, 2010, *L. langdong* Wang & Li sp. nov., and *L. dashui* Wang & Li sp. nov., but can be distinguished by the male pedipalpal tibia I spine strong (Fig. 20D), conductor bamboo leaf-shaped in ventral view (Fig. 20B) (tibia I spine strong, asymmetrically bifurcated, conductor C tile-shaped in *L. furcasipina*, tibia I spine strong, tip curved, conductor reduced in *L. langdong* Wang & Li sp. nov., tibia I spine slender, II III spines curved basally, conductor C tile-shaped in *L. dashui* Wang & Li sp. nov.).

**Description. Male (holotype).** Total length 1.80 (Fig. 20A). Carapace 0.87 long, 0.90 wide. Opisthosoma 0.90 long, 0.75 wide. Carapace yellow. Eyes four, PME absent, ALE and PLE reduced to white points. Median groove needle-shaped, pale brown, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma whitish gray, ovoid, lacking distinctive pattern. Leg measurements: I 7.88 (2.13, 0.33, 2.20, 1.92, 1.30); II 6.41 (1.63, 0.30, 1.75, 1.58, 1.15); III 5.40 (1.50, 0.30, 1.45, 1.23, 0.92); IV 7.43 (1.80, 0.33, 2.10, 1.72, 1.48). Male pedipalp (Figs 20C–D): tibia with 3 long setae prolaterally, 5 spines retrolaterally, with I spine strong, longest, tip curved. Cymbium with no wrinkled medially, earlobe-shaped process small. Bulb with spoon-shaped embolus, embolus lobe small. Median apophysis absent. Conductor bamboo leaf-shaped in ventral view (Fig. 20B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 2.25 (Figs 21A–B). Carapace 0.88 long, 0.80 wide. Opisthosoma 1.37 long, 1.13 wide. Clypeus 0.13 high. Leg measurements: I 6.91 (2.10, 0.38, 1.88, 1.47, 1.08); II 6.20 (1.70, 0.35, 1.75, 1.40, 1.00); III 4.97 (1.37, 0.30, 1.25, 1.22, 0.83); IV 6.98 (1.88, 0.38, 1.92, 1.67, 1.13). Vulva (Fig. 21C): spermathecae coiled, atrium trapezoidal, anterior margin of atrium wavy line-shaped, covered with short hairs.

**Distribution.** China (Guizhou).

*Leptonetela qiangdao* Wang & Li sp. nov.

Figs 22–23, 97

**Type material.** Holotype: male (IZCAS), Menglonggong Cave, 27.07°N, 107.76°E, Langdong Village, Huangping County, Qiandongnan Prefecture, Guizhou Province, China, 3 March 2013, H. Zhao & J. Liu leg. **Paratypes:** 1 male and 2 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. furcasipina* Lin & Li, 2010, *L. qiangdao* Wang & Li sp. nov., and *L. dashui* Wang & Li sp. nov., but can be distinguished by the male pedipalpal tibia I spine strong, tip curved (Fig. 22D), conductor reduced (Fig. 22B) (tibia I spine strong, asymmetrically bifurcated, conductor C tile-shaped in *L. furcasipina*, tibia I spine strong, conductor bamboo leaf-shaped in *L. qiangdao* Wang & Li sp. nov., tibia I spine slender, II III spines curved basally, conductor C tile-shaped in *L. dashui* Wang & Li sp. nov.).

**Description. Male (holotype):** total length 2.25 (Fig. 22A). Carapace 1.25 long, 0.87 wide. Opisthosoma 1.13 long, 0.88 wide. Carapace yellowish. Eyes four. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma gray, ovoid. Leg measurements: I 8.91 (2.55, 0.35, 2.55, 2.13, 1.50); II 7.23 (2.00, 0.35, 1.88, 1.75, 1.25); III 6.22 (1.75, 0.34, 1.63, 1.50, 1.00); IV 8.05 (2.25, 0.35, 2.25, 1.90, 1.30). Male pedipalp (Figs 22C–D): femur with

6 spines ventrally, tibia with 3 long spines prolaterally, 1 long seta and 5 spines retrolaterally, with I spine strong, tip curved. Cymbium constricted medially, attaching an earlobe-shaped process. Embolus triangular, bearing a tooth basally, prolateral lobe reduced. Median apophysis absent. Conductor reduced (Fig. 22B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 2.25 (Figs 23A–B). Carapace 1.10 long, 0.60 wide. Opisthosoma 1.25 long, 0.88 wide. Clypeus 0.15 high. Leg measurements: I 7.48 (2.10, 0.38, 2.13, 1.62, 1.25); II 6.14 (1.75, 0.38, 1.63, 1.38, 1.00); III 5.18 (1.50, 0.35, 1.25, 1.20, 0.88); IV 6.86 (2.00, 0.38, 1.88, 1.50, 1.10). Vulva (Fig. 23C): spermathecae coiled, atrium triangular.

**Distribution.** China (Guizhou).

**Leptonetela dashui** Wang & Li sp. nov.

Figs 24–25, 94

**Type material.** Holotype: male (IZCAS), Dashui Cave, 26.61°N, 106.61°E, Shijicheng, Jinyang New Urban Area, Gui Yang City, Guizhou Province, China, 14 June 2011, Z. Zha leg; 5 females, Niu Cave, 26.86°N, 108.93°E, Cenge, Namning Town, Jianhe County, Kaili City, Guizhou Province, China, 14 December 2011, Z. Zha leg.

**Etymology.** The specific name refers to the type locality; noun.

**Description.** Male (holotype). Total length 2.63 (Fig. 26A). Carapace 0.88 long, 0.75 wide. Opisthosoma 1.00 long, 0.75 wide. Carapace yellowish. Eyes absent. Median groove, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma gray, ovoid. Leg measurements: I 8.24 (2.25, 0.38, 2.43, 1.88, 1.30); II 7.16 (1.98, 0.35, 2.00, 1.63, 1.20); III 6.06 (1.75, 0.33, 1.60, 1.50, 0.88); IV 7.69 (2.13, 0.38, 2.08, 1.85, 1.25). Male pedipalp (Figs 24C–D): femur with 4 spines ventrally, tibia with 2 long setae prolaterally, 2 long setae and 5 slender spines retrolaterally, the spines equally strong, I spine longest. Cymbium not wrinkled, earlobe-shaped process small. Embolus triangular, prolateral lobe reduced. Median apophysis absent. Conductor C tile-shaped in ventral view (Fig. 24B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 1.93 (Figs 25A–B). Carapace 0.78 long, 0.75 wide. Opisthosoma 1.18 long, 1.00 wide. Clypeus 0.15 high. Leg measurements: I 6.02 (1.68, 0.28, 1.73, 1.30, 1.03); II 5.29 (1.45, 0.28, 1.43, 1.25, 0.88); III 4.34 (1.25, 0.25, 1.13, 1.03, 0.68); IV 5.67 (1.63, 0.28, 1.58, 1.28, 0.90). Vulva (Fig. 25C): spermathecae coiled, atrium fusiformed, anterior margin with mastoid process medially.

**Distribution.** China (Guizhou).

**Leptonetela gang** Wang & Li sp. nov.

Figs 26–27, 94

**Type material.** Holotype: male (IZCAS), Gang Cave, 26.87°N, 108.91°E, Tunhou, Nanning Town, Jianhe County, Kaili City, Guizhou Province, China, 15 December 2011, Z. Zha leg.

**Paratypes:** 15 males and 6 females, same data as holotype; 4 males and 5 females, Long Cave, 26.85°N, 108.79°E, Longtang, Liangshang Town, Sansui County, Kaili City, Guizhou Province, China, 18 December 2011, Z. Zha leg; 5 males and 5 females, Shenxian Cave, 26.87°N, 108.89°E, Shixing, Xiaolan Country, Nanning Town, Jianhe County, Kaili City, Guizhou Province, China, 16 December 2011, Z. Zha leg; 5 females, Niu Cave, 26.86°N, 108.93°E, Cenge, Namning Town, Jianhe County, Kaili City, Guizhou Province, China, 14 December 2011, Z. Zha leg.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. jiulong* Lin & Li, 2010, but can be distinguished by the male pedipalpal tibia with 6 spines retrolaterally, II spine thickest, I, II spines equally length, II spine asymmetrically bifurcated (Fig. 26D), median apophysis absent, conductor reduced (Fig. 26B) (I, II spines equally strong, II spine longest and bifurcate, I spinhe half the length of II, median apophysis broad and smooth, conductor rugose, triangular in *L. jiulong*).

**Description.** Male (holotype). Total length 2.63 (Fig. 26A). Carapace 1.25 long, 1.00 wide. Opisthosoma 1.50 long, 1.13 wide. Carapace yellow. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, cervical grooves and radial furrows distinct. Clypeus 0.13 high. Opisthosoma gray, ovoid. Leg measurements: I 10.66 (3.00, 0.38, 3.13, 2.55, 1.60); II 8.96 (2.50, 0.38, 2.55, 2.13, 1.40); III 7.55 (2.25, 0.35, 2.00, 1.75, 1.20); IV 9.68 (2.75, 0.38, 2.75, 2.35, 1.45). Male pedipalp (Figs 26C–D): tibia with 5 long spines prolaterally, 6 spines retrolaterally, II spine thickest asymmetrically bifurcated, I II spine equally length. Cymbium constricted medially, attaching an earlobe-shaped process. Embolus triangular, median apophysis absent, conductor reduced (Fig. 26B).

**Female (one of the paratypes).** Similar to male in color and general features, but smaller and with shorter legs. Total length 2.38 (Figs 27A–B). Carapace 1.00 long, 0.88 wide. Opisthosoma 1.50 long, 1.20 wide. Clypeus 0.13 high. Leg measurements: I 9.26 (2.50, 0.38, 2.75, 2.13, 1.50); II 7.51 (2.00, 0.38, 2.13, 1.75, 1.25); III 6.29 (1.88, 0.38, 1.63, 1.40, 1.00); IV 8.11 (2.25, 0.38, 2.25, 1.88, 1.35). Vulva (Fig. 27C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Guizhou).

Leptonetela la Wang & Li sp. nov.
Figs 28–29, 94

Type material. Holotype: male (IZCAS), Xiaoyakoula Cave, 25.80°N, 104.95°E, Puan County, Qianxinan Prefecture, Guizhou Province, China, 14 July 2012, H. Zhao leg. Paratypes: 3 males and 5 females, same data as holotype.

Diagnosis. This new species is similar to L. rudong Wang & Li sp. nov., and L. wenzhu Wang & Li sp. nov. but can be distinguished from L. wenzhu Wang & Li sp. nov. by the male pedipalpal tibia with 7 spines retrolaterally, with I spine strongest, conductor bamboo leaf-shaped in L. wenzhu Wang & Li sp. nov.; from L. rudong Wang & Li sp. nov. by the tibia with 4 long setae prolaterally (Fig. 28D) (tibia with 2 long setae, 2 spines prolaterally, 1 long seta, and 6 spines retrolaterally, with I spine strongest, conductor bamboo leaf-shaped in L. wenzhu Wang & Li sp. nov.).

Description. Male (holotype). Carapace 1.09 long, 1.01 wide. Opisthosoma 1.25 long, 1.05 wide. Carapace yellow. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma brown, ovoid. Leg measurements: I 10.15 (2.84, 0.38, 3.00, 2.38, 1.55); II 7.84 (2.08, 0.38, 2.23, 1.88, 1.27); III 6.55 (1.83, 0.35, 1.75, 1.62, 1.00); IV 8.31 (2.25, 0.38, 2.38, 2.05, 1.25). Male pedipalp (Figs 28C–D): tibia with 4 long setae prolaterally and 7 slender spines retrolaterally, I II spines equally length, longer than others. Cymbium constricted mediately, attaching an earlobe-shaped process. Embolus triangular, proliferate lobe oval. Median apophysis absent. Conductor C tile-shaped in ventral view (Fig. 28B).

Female (one of the paratypes). Similar to male in color and general features, but smaller and with shorter legs. Total length 2.81 (Figs 29A–B). Carapace 1.09 long, 1.01 wide. Opisthosoma 1.69 long, 1.47 wide. Clypeus 0.17 high. Leg measurements: I 9.68 (2.56, 0.40, 2.97, 2.13, 1.62); II 8.23 (2.34, 0.34, 2.43, 1.81, 1.31); III 7.03 (2.19, 0.34, 2.03, 1.38, 1.09); IV 9.13 (2.51, 0.34, 2.59, 2.38, 1.31). Vulva (Fig. 29C): spermathecae coiled, atrium fusiformed, anterior margin of atrium with one large mastoid process medially, and covered with short hairs.

Distribution. China (Guizhou).

Diagnosis. This new species is similar to *L. rudong* Wang & Li sp. nov., *L. la* Wang & Li sp. nov. but can be distinguished by the male pedipalpal tibia with 6 spines retrolaterally (Fig. 32D), conductor bamboo leaf-shaped in ventral view (Fig. 32B) (tibia with 1 long seta, 6 spines retrolaterally in *L. rudong* Wang & Li sp. nov., tibia with 7 spines retrolaterally in *L. la* Wang & Li sp. nov., conductor broad, C tile-shaped in *L. la* Wang & Li sp. nov.; thin, triangular in *L. rudong* Wang & Li sp. nov.).

Description. Male (holotype). Total length 2.63 (Fig. 32A). Carapace 1.28 long, 1.03 wide. Opisthosoma 1.34 long, 1.09 wide. Carapace yellowish. Ocular area with a pair of setae, PME PLE absent, ALE reduced to white points. Median groove, cervical grooves and radial furrows indistinct. Clypeus 0.25 high. Opiolithosa gray, ovoid. Leg measurements: I 10.17 (2.78, 0.37, 3.12, 2.34, 1.56); II 7.34 (2.53, 0.37, 1.94, 1.72, 0.78); III 7.70 (2.19, 0.37, 2.03, 1.88, 1.22); IV 9.28 (2.60, 0.37, 2.56, 2.28, 1.47). Male pedipalp (Figs 32C–D): tibia with 6 spines retrolaterally, arrange equidistantly. Embolus triangular, prolateral lobe absent. Median apophysis absent. Conductor bamboo leaf-shaped in ventral view (Fig. 32B).

Female (one of the paratypes). Similar to male in color and general features, but larger and with shorter legs. Total length 2.88 (Figs 33A–B). Carapace 1.20 long, 1.00 wide. Opisthosoma 1.60 long, 1.20 wide. Clypeus 0.18 high. Leg measurements: I 8.62 (2.53, 0.37, 2.51, 1.90, 1.31); II 7.36 (2.09, 0.34, 1.94, 1.65, 1.34); III 6.18 (1.55, 0.31, 1.69, 1.47, 1.16); IV 7.98 (2.44, 0.31, 2.01, 1.88, 1.34). Vulva (Fig. 33C): spermathecae coiled, atrium fusiformed.

Distribution. China (Guizhou).

Leptonetela panbao Wang & Li sp. nov.

Figs 36–37, 97

Type material. Holotype: male (IZCAS), Panbao Cave, 28.38°N, 108.67°E, Panbao, Shichang Town, Songtao County, Tongren City, Guizhou Province, China, 8 March 2013, H. Zhao & J. Liu leg. Paratypes: 2 male and 4 females, same data as holotype.

Etymology. The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to *L. chiosensis* Wang & Li, 2011, *L. Longli* Wang & Li sp. nov., but can be distinguished by the male pedipalpal tibia with 1 spine, equally strong, cymbium with 1 strong spine on the earlobe-shaped process, conductor reduced, embolus with 1 tooth basally in *L. panbao* Wang & Li sp. nov. (tibia I strong, conductor triangular in *L. chiosensis*; tibia spines slender, cymbium with 1 strong spine on the earlobe-shaped process, conductor reduced, embolus with 1 tooth basally in *L. panbao* Wang & Li sp. nov.).

Description. Male (holotype). Total length 2.38 (Fig. 36A). Carapace 1.15 long, 1.00 wide. Opisthosoma 1.25 long, 0.90 wide. Carapace yellow. Eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opiolithosa gray, ovoid. Leg measurements: I 10.50 (2.75, 0.35, 3.50, 2.40, 1.50); II 8.43 (2.35, 0.35, 2.35, 1.90, 1.13); III 6.22 (1.75, 0.34, 1.75, 1.38, 1.00); IV 5.71 (0.25, 0.25, 1.60, 3.5, 0.88). Male pedipalp (Figs 36C–D): tibia with 3 long spines prolaterally, 5 slender spines retrolaterally, I spine strongest, I, II III spines equally strong, stronger than others. Embolus triangular, prolateral lobe reduced. Median apophysis "*"/" shaped in ventral view. Conductor C tile-shaped in ventral view (Fig. 36B).

Female (one of the paratypes). Similar to male in color and general features, but larger and with shorter legs. Total length 3.38 (Figs 35A–B). Carapace 0.88 long, 0.88 wide. Opiolithosa 1.25 long, 1.00 wide. Clypeus 0.10 high. Leg measurements: I 5.03 (1.38, 0.25, 1.50, 1.15, 0.75); II 4.58 (1.25, 0.25, 1.13, 1.10, 0.85); III 3.55 (1.00, 0.20, 0.88, 0.67, 0.60); IV 4.76 (1.30, 0.25, 1.38, 1.13, 0.70). Vulva (Fig. 35C): spermathecae coiled, atrium fusiformed.

Distribution. China (Guangxi).

Leptonetela panbao Wang & Li sp. nov.

Figs 36–37, 97

Type material. Holotype: male (IZCAS), Panbao Cave, 28.38°N, 108.67°E, Panbao, Shichang Town, Songtao County, Tongren City, Guizhou Province, China, 8 March 2013, H. Zhao & J. Liu leg. Paratypes: 2 male and 4 females, same data as holotype.

Etymology. The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to *L. chiosensis* Wang & Li, 2011, *L. Longli* Wang & Li sp. nov., but can be distinguished by the male pedipalpal tibia with 1 spine, equally strong, cymbium with 1 strong spine on the earlobe-shaped process (Fig. 36D), conductor reduced, embolus with 1 tooth basally (Fig. 36B) (tibia I spine stronger than others, conductor triangular in *L. chiosensis*; tibia I, II and III spines equally strong, stronger than others, conductor C tile-shaped in *L. panbao* Wang & Li sp. nov.).

Description. Male (holotype). Total length 2.38 (Fig. 36A). Carapace 0.87 long, 0.75 wide. Opiolithosa 1.00 long, 0.80 wide. Carapace yellowish. Ocular area with a pair of setae, eyes six. Median groove, cervical grooves and radial furrows indistinct. Clypeus 0.10 highly. Opiolithosa gray, ovoid. Leg measurements: I 6.38 (1.75, 0.25, 1.88, 1.50, 1.00); II 5.03 (1.40, 0.25, 1.38, 1.25, 0.75); III 4.25 (1.37, 0.20, 1.13, 1.00, 0.55); IV 5.71 (1.63, 0.25, 1.60, 3.5, 0.88). Male pedipalp (Figs 34C–D): tibia with 3 long spines prolaterally, 5 slender spines retrolaterally, I spine longest, I, II III spines equally strong, stronger than others. Embolus triangular, prolateral lobe reduced. Median apophysis "*"/" shaped in ventral view. Conductor C tile-shaped in ventral view (Fig. 34B).

Female (one of the paratypes). Similar to male in color and general features, but larger and with shorter legs. Total length 2.28, 1.47). Male pedipalp (Figs 32C–D): tibia with 6 spines retrolaterally, arrange equidistantly. Embolus triangular, prolateral lobe absent. Median apophysis absent. Conductor bamboo leaf-shaped in ventral view (Fig. 32B).

2.50 (Figs 37A–B). Carapace 1.13 long, 1.00 wide. Opisthosoma 1.62 long, 1.25 wide. Clypeus 0.13 high. Leg measurements: I 8.85 (2.30, 0.30, 2.62, 2.13, 1.50); II 6.81 (1.88, 0.30, 2.00, 1.50, 1.13); III 5.76 (1.63, 0.25, 1.63, 1.25, 1.00); IV 7.58 (2.25, 0.30, 2.13, 1.75, 1.15). Vulva (Fig. 37C): spermathecae coiled, atrium triangular, anterior margin of atrium covered with short hairs.

Distribution. China (Guizhou).

Leptonetela feilong Wang & Li sp. nov. Figs 38–39, 97

Type material. Holotype: male (IZCAS), Feilong Cave, 26.44°N, 107.02°E, Longli Town, Qiannan Prefecture, Guizhou Province, China, 27 July 2012, H. Zhao leg. Paratypes: 9 females, same data as holotype; 1 female, Lianhua Cave, 26.43°N, 106.95°E, Lianhua Town, Qiannan Prefecture, Guizhou Province, China, 27 July 2012, H. Zhao leg.

Etymology. The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to L. yangi Lin & Li, 2010, but can be distinguished from L. yangi by the male pedipalpal cymbium constricted medially, attaching an earlobe-shaped process (Fig. 38D), conductor triangular (Fig. 38B) (cymbium not constricted, earlobe-shaped process absent, conductor reduced in L. yangi). Conductor C tile-shaped in median apophysis like mastoid process, with 3 sclerotized spots (median apophysis “m” shaped, earlobe-shaped process, and 1 curved, long spine retrolaterally, spines I, II, III equally strong, I spine longest. Cymbium constricted medially, attaching 1 curved spine and an earlobe-shaped process, which decorated with 1 short spine. Embolus triangular, and prolateral lobe absent. Median apophysis like mastoid process, with 3 sclerotized spots distally, conductor C tile-shaped in L. yangi (Fig. 40B).

Description. Male (holotype). Total length 2.43 (Fig. 40A). Carapace 1.03 long, 0.90 wide. Opisthosoma 1.43 long, 1.22 wide. Carapace yellowish. Ocular area with a pair of setae, eyes six. Median groove, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma white, ovoid. Leg measurements: I 9.22 (2.48, 0.38, 2.66, 2.20, 1.50); II 7.58 (2.13, 0.35, 2.20, 1.75, 1.15); III 6.21 (1.75, 0.30, 1.63, 1.53, 1.00); IV 8.11 (2.25, 0.35, 2.13, 2.00, 1.38). Male pedipalp (Figs 38C–D): tibia with 5 slender spines retrolaterally, I, II and III spines equally strong, stronger than others, I spine longest. Cymbium constricted medially, retrolaterally attaching 1 curved spine and an earlobe-shaped process, which decorated with 1 short spine. Embolus triangular, and prolateral lobe absent. Median apophysis like mastoid process, with 3 sclerotized spots distally. Conductor C tile-shaped (Fig. 40B).

Female (one of the paratypes). Similar to male in color and general features, but smaller and with shorter legs. Total length 2.30 (Figs 41A–B). Carapace 0.93 long, 0.80 wide. Opisthosoma 1.45 long, 1.28 wide. Clypeus 0.13 high. Leg measurements: I (1.95, 0.38, -,-,-); II 5.91 (1.63, 0.35, 1.70, 1.25, 0.98); III 4.96 (1.38, 0.33, 1.30, 1.12, 0.83); IV 6.53 (1.85, 0.35, 1.78, 1.50, 1.05). Vulva (Fig. 41C): spermathecae coiled, atrium fusiformed.

Distribution. China (Guangxi).

Leptonetela xianren Wang & Li sp. nov. Figs 42–43, 97

Type material. Holotype: male (IZCAS), Xianren Cave, 29.73°N, 110.31°E, Yipingxini, Zouma Town, Hefeng County, Enshi Tujia and Miao Autonomous Prefecture, Hubei Province, China, 27 January 2011, Y. Li & J. Liu leg. Paratypes: 2 males and 3 females, same data as holotype.

Eymology. The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to L. liping Lin & Li, 2010, and L. parlonga Wang & Li, 2011, but can be distinguished by the male pedipalpal tibia with 5 slender spines retrolaterally, with spine longest (Fig. 42D) (tibia with 5 spines retrolaterally, I spine strong and longest in L. liping, 6 slender spines in L. parlonga); median apophysis triangular (Fig. 42B) (median apophysis like mastoid process in L. liping, ligulate in L. parlonga); from L. parlonga by the cymbium retrolaterally with 1 ox horn-shaped spine on the earlobe-shaped process in L. parlonga.

Description. Male (holotype). Total length 2.23 (Fig. 42A). Carapace 0.95 long, 0.93 wide. Opisthosoma 1.25 long, 0.88 wide. Carapace yellow. Ocular area with a pair of setae, eyes absent. Median groove, cervical groove and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma gray, ovoid, lacking distinctive pattern. Leg measurements: I 8.99 (2.50, 0.38, 2.48, 2.00, 1.63); II 8.48 (2.38, 0.37, 2.28, 1.90, 1.55); III 7.12 (2.03, 0.33, 1.88, 1.63, 1.25); IV 7.88 (2.48, 0.38, 2.07, 1.60, 1.35). Leg formula: I-II-IV-III. Male pedipalp (Figs 42C–D): femur with 5 spines ventrally, tibia with 3 long setae prolaterally, 2 long setae and 5 slender spines retrolaterally, with I spine longest. Cymbium constricted medially, attaching an earlobe-shaped process retrolaterally. Embolus triangular, prolateral lobe indistinct. Median apophysis triangular. Conductor bamboo leaf-shaped in ventral view (Fig. 42B).

Female (one of the paratypes). Similar to male in color and general features, but smaller and with shorter legs. Total length 2.03 (Figs 43A–B). Carapace 0.85 long, 0.83 wide. Opisthosoma 1.55 long, 1.03 wide. Clypeus 0.15 high. Opisthosoma gray, ovoid, lacking distinctive pattern. Leg measurements: I 8.11 (2.25, 0.38, 2.20, 1.88, 1.40); II 7.71 (2.18, 0.35, 2.13, 1.70, 1.35); III 6.76 (2.00, 0.35, 1.78, 1.50, 1.13); IV 7.79 (2.45, 0.40, 2.03, 1.58, 1.33). Vulva (Fig. 43C): spermathecae coiled, atrium fusiformed.

Distribution. China (Hubei).

Leptonetela tiankeng Wang & Li sp. nov. Figs 44–45, 97

Type material. Holotype: male (IZCAS), Tiankeng Cave, 26.64°N, 104.80°E, Hegou, Dewu Town, Zhongshan County, Liupanshui City, Guizhou Province, China, 9 November 2011, H. Chen & Z. Zha leg. Paratypes: 4 males and 5 females, same data as holotype; 2 females, Luoshui Cave, 26.64°N, 104.80°E, Hegou, Dewu Town, Zhongshan County, Liupanshui City, Guizhou Province, China, 9 November 2011, H. Chen & Z. Zha leg.

Eymology. The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to L. rudicula Wang & Li, 2011, but can be distinguished by the male pedipalpal tibia with 6 spines retrolaterally (Fig. 44D), prolateral lobe indistinct (Fig. 44C), conductor broad and long, distal edge wavy line-shaped (Fig. 44B) (5 spines retrolaterally, prolateral lobe oval, conductor short, C tile-shaped L. rudicula).

Description. Male (holotype). Total length 2.03 (Fig. 44A). Carapace 1.00 long, 0.85 wide. Opisthosoma 1.10 long, 0.88 wide. Carapace yellow. Ocular area with a pair of setae, eyes absent. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma yellowish, ovoid. Leg measurements: I 9.30 (2.48, 0.35, 2.81, 2.23, 1.43); II 8.46 (2.35, 0.35, 2.30, 2.18, 1.28); III 7.11 (2.05, 0.30, 1.98, 1.75, 1.03); IV 8.51 (2.43, 0.35, 2.33, 2.15, 1.25). Male pedipalp (Figs 44C–D): tibia with 5 long setae prolaterally, 6 slender spines retrolaterally, with I spine longest. Cymbium slightly constricted medially, attaching an earlobe-shaped process retrolaterally. Embolus triangular, prolateral lobe indistinct. Median apophysis flake-like, sclerotized distally. Conductor broad, distal edge wavy line-shaped (Fig. 44B).

Female (one of the paratypes). Similar to male in color and general features, but smaller and with shorter legs. Total length 1.93 (Figs 45A–B). Carapace 0.83 long, 0.73 wide. Opisthosoma 1.13 long, 0.98 wide. Clypeus 0.13 high. Leg measurements: I 7.68 (2.23, 0.34, 2.23, 1.63, 1.25); II 6.41 (1.90, 0.35, 1.78, 1.38, 1.00); III 5.69 (1.68, 0.28, 1.58, 1.38, 0.77); IV 7.19 (2.00, 0.33, 2.03, 1.70, 1.13). Vulva (Fig. 45C): spermathecae coiled, atrium triangular.

Distribution. China (Guizhou).

Leptonetela mayang Wang & Li sp. nov. Figs 46–47, 94

Type material. Holotype: male (IZCAS), Mayang Cave, 28.55°N, 108.06°E, Quankou, Dejiang County, Tongren City, Guizhou Province, China, 10 August 2012, H. Zhao leg. Paratype: 1 female, same data as holotype.

Eimony. The specific name refers to the type locality; noun.

Diagnosis. This new species can be distinguished from all other species of the genus by the male pedipalpal cymbium retrolaterally with one curved, short spine medially, median apophysis triangle, spermathecae not tightly twisted, just screwy in the female.

Description. Male (holotype). Total length 2.13 (Fig. 46A). Carapace 1.10 long, 0.75 wide. Opisthosoma 0.90 long, 1.00 wide. Carapace white. Eye absent. Median groove, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma white, ovoid. Leg measurements: I 8.98 (2.50, 0.30, 2.63, 2.05, 1.50); II 7.68 (2.13, 0.30, 2.25, 1.75, 1.25); III 6.76 (2.00, 0.25, 1.88, 1.63, 1.00); IV 8.21 (2.25, 0.30, 2.38, 1.88, 1.40). Male pedipalp (Figs 46C–D): tibia with 3 long setae prolaterally, and 5 slender spines retrolaterally, the spine I longest. Cymbium not wrinkled, earlobe-shaped process retrolaterally, and with 1 curved, short spine retrolaterally. Bulb with spoon-shaped embolus, prolateral lobe indistinct. Median

apophysis triangular in ventral view. Conductor thin, triangular in ventral view (Fig. 46B).

**Female.** Similar to male in color and general features, but larger and with shorter legs. Total length 2.37 (Figs 47A–B). Carapace 0.88 long, 0.88 wide. Opisthosoma 1.65 long, 1.00 wide. Clypeus 0.13 high. Leg measurements: I - (2.25, 0.30, -, -, -); II 6.81 (2.00, 0.30, 1.88, 1.50, 1.13); III 6.16 (1.88, 0.25, 1.75, 1.38, 0.90); IV 7.28 (2.13, 0.30, 2.00, 1.60, 1.25). Vulva (Fig. 47C): spermathecae screwy, atrium triangular.

**Distribution.** China (Guizhou).

**Leptonetela gubin Wang & Li sp. nov.**

Figs 48–49, 97

**Type material.** Holotype: male (IZCAS), Gubin River, 26.50°N, 107.52°E, Gubin, Xingshan Town, Majiang County, Shengkali City, Guizhou Province, China, 28 November 2011, H. Chen & Z. Zha leg. **Paratypes:** 22 males and 14 females, same data as holotype; 4 males and 5 females, nameless Cave, 26.50°N, 107.52°E, Gubin, Xingshan Town, Majiang County, Shengkali City, Guizhou Province, China, 28 November 2011, H. Chen & Z. Zha leg.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. jinsha* Lin & Li, 2010, *L. quinquespinata* (Chen & Zhu, 2008) *L. xinhua* Wang & Li sp. nov., *L. lujia* Wang & Li sp. nov. and *L. xinhua* Wang & Li sp. nov.; but can be distinguished by the male pedipalpal tibia with 4 slender spines prolaterally, 5 slender spines retrolaterally, with I, II spines equally length, cymbium with 2 long curved spines on earlobe-shaped process retrolaterally (Fig. 48D) (tibia with 3 long setae prolaterally, 1 long setae and 5 spines retrolaterally, with I, II spines equally length, cymbium with 2 long curved spines retrolaterally, with I spine longest, II spine strongest, tip asymmetrically bifurcated in *L. jinsha*; tibia with 3 long setae prolaterally, 6 large spines retrolaterally, with I spine longest in *L. quinquespinata*; tibia with 4 long setae prolaterally, 5 slender spines retrolaterally, with I spine longest, II spine equally length in *L. lujia* Wang & Li sp. nov.; embolus bifurcated, tibia with 5 slender spines prolaterally, 5 slender spines retrolaterally, conductor triangular in *L. xinhua* Wang & Li sp. nov.; from *L. jinsha*, *L. lujia* Wang & Li sp. nov. and *L. xinhua* Wang & Li sp. nov. by the conductor semicircular, base of median apophysis distinctly swollen, 4 times wider than the tip (Fig. 48B) (conductor broad, tip wavy line-shaped in *L. jinsha*; conductor thin, triangular in *L. lujia* Wang & Li sp. nov. and *L. xinhua* Wang & Li sp. nov. by the conductor semicircular, base of median apophysis distinctly swollen, 4 times wider than the tip (Fig. 48B)); from *L. gubin* Wang & Li sp. nov.; *L. quinquespinata*; embolus bifurcated, tibia with 5 slender spines prolaterally, 5 slender spines retrolaterally, conductor triangular in *L. xinhua* Wang & Li sp. nov.; from *L. jinsha*, *L. lujia* Wang & Li sp. nov. and *L. xinhua* Wang & Li sp. nov.; base of median apophysis slightly swollen in *L. jinsha*, *L. lujia* Wang & Li sp. nov. & *L. xinhua* Wang & Li sp. nov.); from *L. gubin* and *L. quinquespinata* by the base of median apophysis slightly swollen (Fig. 50B) (base of median apophysis distinctly swollen, 4 times the width of tip in *L. gubin* Wang & Li sp. nov.; 3 times in *L. quinquespinata*).

**Description.** **Male (holotype).** Total length 1.88 (Fig. 48A). Carapace 0.80 long, 0.78 wide. Opisthosoma 1.13 long, 0.93 wide. Carapace yellowish. Ocular area with a pair of setae, eyes absent. Median groove need-shaped, cervical grooves and radial furrows distinct. Clypeus 0.13 high. Opisthosoma gray, ovoid, lacking distinctive pattern. Leg measurements: I 7.51 (2.00, 0.38, 2.13, 1.75, 1.25); II 6.48 (1.75, 0.35, 1.80, 1.43, 1.15); III 5.51 (1.63, 0.35, 1.40, 1.25, 0.88); IV 6.82 (1.88, 0.35, 1.88, 1.58, 1.13). Male pedipalp (Figs 48C–D): tibia with 4 long spines prolaterally and 5 spines retrolaterally, with I, II spines equally length. Cymbium constricted medially, earlobe-shaped process with 2 long curved spines retrolaterally. Embolus triangular, prolateral lobe absent. Median apophysis digital-shaped, base distinctly swollen. Conductor smooth, semicircle in ventral view (Fig. 48B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with longer legs. Total length 2.30 (Figs 49A–B). Carapace 0.88 long, 0.85 wide. Opisthosoma 1.40 long, 0.95 wide. Clypeus 0.15 high. Leg measurements: I 7.69 (2.13, 0.38, 2.25, 1.65, 1.28); II 6.71 (1.90, 0.38, 1.95, 1.40, 1.08); III 5.85 (1.75, 0.35, 1.50, 1.35, 0.90); IV 7.02 (2.00, 0.38, 1.93, 1.58, 1.13). Vulva (Fig. 49C): spermathecae coiled, atrium triangular.

**Distribution.** China (Guizhou).

**Leptonetela lujia Wang & Li sp. nov.**

Figs 50–51, 97

**Type material.** Holotype: male (IZCAS), Wuming Cave, 26.48°N, 107.54°E, Lujia Bridge, Gubin, Xingshan Town, Majiang County, Kaili City, Guizhou Province, China, 29 November 2011, H. Chen & Z. Zha leg. **Paratypes:** 1 male and 2 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. jinsha* Lin et Li, 2010, *L. quinquespinata* (Chen & Zhu, 2008) *L. xinhua* Wang & Li sp. nov. and *L. gubin* Wang & Li sp. nov.; but can be distinguished by the male pedipalpal tibia with 4 long setae prolaterally, 5 slender spines retrolaterally, with I spine longest, II, III spines equally length (Fig. 50D), conductor thin, triangular (Fig. 50B), (tibia with 3 long setae prolaterally, 1 long setae and 5 spines retrolaterally, with I spine strongest, tip asymmetrically bifurcated, conductor broad, distal edge wavy line-shaped in *L. jinsha*; tibia with 3 long setae prolaterally, 6 slender spines retrolaterally, with I spine longest, conductor semicircular in *L. quinquespinata*; embolus bifurcated, tibia with 5 slender spines prolaterally, 5 slender spines retrolaterally, conductor triangular in *L. xinhua* Wang & Li sp. nov.; from *L. jinsha*, *L. lujia* Wang & Li sp. nov. and *L. xinhua* Wang & Li sp. nov. by the conductor semicircular, base of median apophysis distinctly swollen, 4 times wider than the tip (Fig. 48B) (conductor broad, tip wavy line-shaped in *L. jinsha*; conductor thin, triangular in *L. lujia* Wang & Li sp. nov. and *L. xinhua* Wang & Li sp. nov. by the conductor semicircular, base of median apophysis slightly swollen in *L. jinsha*, *L. lujia* Wang & Li sp. nov. & *L. xinhua* Wang & Li sp. nov.)).

absent. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.12 high. Opisthosoma yellowish, ovoid. Leg measurements: I 7.75 (2.10, 0.37, 2.23, 1.78, 1.27); II 6.97 (1.96, 0.37, 1.86, 1.62, 1.16); III 5.73 (1.62, 0.32, 1.50, 1.32, 0.97); IV 7.15 (2.02, 0.30, 1.92, 1.80, 1.11). Male pedipalp (Figs 50C–D): tibia with 4 long spines retrolaterally, 5 large spines retrolaterally, with I spine longest. III II spines equally length. Cymbium not constricted medially, earlobe-shaped process distinct. Embolus triangular, prolateral lobe indistinct. Median apophysis index finger like. Conductor thin, triangular in ventral view (Fig. 50B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 1.70 (Figs 51A–B). Carapace 0.85 long, 0.75 wide. Opisthosoma 0.87 long, 0.83 wide. Clypeus 0.12 high. Leg measurements: I 6.89 (1.85, 0.37, 1.97, 1.50, 1.20); II 5.94 (1.67, 0.35, 1.62, 1.25, 1.05); III 5.30 (1.48, 0.35, 1.38, 1.22, 0.87); IV 6.47 (1.86, 0.37, 1.70, 1.46, 1.08). Vulva (Fig. 51C): spermathecae coiled, atrium triangular.

**Distribution.** China (Guizhou).

*Leptonetela xinhua* Wang & Li sp. nov. Figs 52–53, 97

**Type material.** Holotype: male (IZCAS), nameless Cave, 27.85N, 111.31E, Caojia Town, Xinhua County, Loudi City, Hunan Province, China, 26 March 2016, Y. Li & Z. Chen leg.

**Paratypes:** 3 males and 2 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. jinsha* Lin & Li, 2010, *L. quinquespinata* (Chen & Zhu, 2008), *L. lujia* Wang & Li sp. nov., and *L. gubin* Wang & Li sp. nov., but can be distinguished by the embolus bifurcated, male pedipalpal tibia with 5 slender spines prolaterally, 5 slender spines retrolaterally, conductor triangular (Fig. 52D), (tibia with 4 long setae prolaterally, 5 slender spines retrolaterally, with I spine longest, II III spines equally length, conductor thin, triangular in *L. lujia* Wang & Li sp. nov.; tibia with 3 long setae prolaterally, 1 long setae and 5 spines retrolaterally, with I spine strongest, tip asymmetrically bifurcated, conductor broad, distal edge wavy line-shaped in *L. jinsha*; tibia with 3 long setae prolaterally, 6 slender spines retrolaterally, with I spine longest, conductor semicircular in *L. quinquespinata*; tibia with 4 slender spines prolaterally, 5 slender spines retrolaterally, with I, II spines equally length, cymbium with 2 long curved spines on earlobe-shaped process retrolaterally, conductor semicircle in *L. gubin* Wang & Li sp. nov.; from *L. gubin* and *L. quinquespinata* by the base of median apophysis distinctly swollen, 4 times the width of tip in *L. gubin* Wang & Li sp. nov.; 3 times in *L. quinquespinata*).

**Description.** Male (holotype): total length 1.78 (Fig. 52A). Prosoma 0.85 long, 0.71 wide. Opisthosoma 0.94 long, 0.73 wide. Prosoma yellowish. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, brown. Cervical grooves and radial furrows indistinct. Clypeus 0.14 high, slightly sloped anteriorly. Opisthosoma pale brown, ovoid, covered with short hairs, lacking distinctive pattern. Sternum and legs yellowish. Leg measurements: I 5.39 (1.52, 0.28, 1.58, 1.20, 0.81); II 4.37 (1.28, 0.29, 1.28, 1.01, 0.51); III 3.84 (1.03, 0.25, 0.98, 0.95, 0.63); IV 5.15 (1.36, 0.27, 1.50, 1.23, 0.79). Leg formula: I-IV-II-III. Male pedipalp (Figs 52C–D): tibia with 5 slender spines prolaterally, 5 slender spines retrolaterally. Cymbium with an earlobe-shaped process retrolaterally. Embolus bifurcated, prolateral lobe triangular. Median apophysis tongue shaped in prolaterally viewed. Conductor triangular in ventral view (Fig. 52B).

**Female (one of the paratypes):** similar to male in color and general features, but with a larger body size and shorter legs. Total length 1.95 (Figs 53A–B). Prosoma 0.66 long, 0.53 wide. Opisthosoma 1.06 long, 0.86 wide. Clypeus 0.20 high. Leg measurements: I 4.60 (1.30, 0.27, 1.33, 0.99, 0.71); II 3.86 (1.11, 0.25, 1.01, 0.85, 0.64); III 3.34 (0.95, 0.24, 0.83, 0.76, 0.56); IV 4.54 (1.33, 0.26, 1.25, 1.03, 0.67). Vulva (Fig. 53C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Hunan).

*Leptonetela kangsa* Wang & Li sp. nov. Figs 54–55, 97

**Type material.** Holotype: male (IZCAS), Kangsagulie Cave, 26.79ºN, 108.21ºE, Datang, Geyi Town, Taijiang County, Kaili City, Guizhou Province, China, 5 Dec 2011, H. Chen & Z. Zha leg.

**Paratypes:** 7 males and 6 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. shibingensis, L. wuming* Wang & Li sp. nov., but can be separated from *L. shibingensis* by the male pedipalpal tibia I spine distinct strong in *L. shibingensis* (Fig. 54D) *L. shibingensis*; from *L. wuming* Wang & Li sp. nov., by the tibia I spine located at the middle of tibia (tibia I spine located at the base of tibia in *L. wuming* Wang & Li sp. nov.); from *L. wuming* Wang & Li sp. nov. by the embolus with 1 basal tooth, conductor bamboo leaf-shaped (Fig. 54B) (embolus without tooth, conductor short, C tile-shaped in *L. wuming* Wang & Li sp. nov.).

**Description.** Male (holotype). Total length 2.07 (Fig. 54A). Carapace 0.85 long, 0.87 wide. Opisthosoma 1.25 long, 0.92 wide. Carapace yellow. Eyes six. PME reduced to white spots. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.12 high. Opisthosoma gray, ovoid. Leg measurements: I 9.04 (2.50, 0.37, 2.65, 2.10, 1.42); II 7.43 (2.10, 0.36, 2.05, 1.70, 1.22); III 6.23 (1.77, 0.37, 1.60, 1.47, 1.02); IV 8.09 (2.22, 0.35, 2.27, 2.00, 1.25). Male pedipalp (Figs 54C–D): tibia with 4 long setae prolaterally, 5 large spines retrolaterally, with I spine strong, located medially. Cymbium constricted medially, attaching an earlobe-shaped process...

retrolaterally. Embolus triangular, bearing a basal tooth, prolateral lobe oval. Median apophysis index finger-like in prolaterally view, tip bifurcated. Conductor bamboo leaf-shaped in ventral view (Fig. 54B).

**Female (one of the paratypes).** Similar to male in color and general features, but smaller and with shorter legs. Total length 2.02 (Figs 55A–B). Carapace 0.72 long, 0.72 wide. Opisthosoma 1.27 long, 1.02 wide. Clypeus 0.15 high. Leg measurements: I 7.61 (2.07, 0.35, 2.25, 1.72, 1.22); II 6.23 (1.72, 0.35, 1.72, 1.37, 1.07); III 5.41 (1.62, 0.32, 1.35, 1.22, 0.90); IV 6.92 (1.80, 0.35, 2.00, 1.65, 1.12). Vulva (Fig. 55C): spermathecae coiled, atrium fusiformed

**Distribution.** China (Guizhou).

**Leptonetela wuming Wang & Li sp. nov.** Figs 56–57, 97

**Type material.** Holotype: male (IZCAS), Wuming Cave, 25.43°N 105.62°E, Dabei Town, Zhenfeng County, Guizhou Province, China, 18 July 2012, H. Zhao leg. Paratypes: 2 males and 5 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. tetracantha* but can be distinguished by the male pedipalpal bulb embolus without basal tooth (Fig. 56B), embolus with basal tooth in all above; from *L. shibingensis* by the tibial I spine located at the base of tibia (Fig. 56D) (tibial I spine located at the base of tibia in all above); from *L. hamata* and *L. tetracantha* by the male pedipalpal tibial I spine strongly, located medially (Fig. 58D) (tibial I spine slender, located at the base of tibia in all above); from *L. hamata* and *L. tetracantha*; and from *L. digitata* by the median apophysis not curved (median apophysis curved in *L. digitata*).

**Description.** Male (holotype). Total length 2.08 (Fig. 58A). Carapace 0.90 long, 0.95 wide. Opisthosoma 1.10 long, 0.83 wide. Carapace yellowish. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma yellowish, ovoid. Leg measurements: I 8.54 (2.25, 0.38, 2.50, 2.03, 1.38); II 6.89 (1.88, 0.38, 1.88, 1.60, 1.15); III 5.70 (1.55, 0.35, 1.47, 1.35, 0.98); IV 7.59 (2.03, 0.38, 2.13, 1.88, 1.17). Male pedipalp (Figs 58C–D): tibia with 4 long spines prolaterally, 5 spines retrorlaterally, with I spine strong, asymmetrically bifurcated and located at the base of tibia. Cymbium constricted medially, attaching an earlobe-shaped process retrorlaterally. Embolus triangular, bearing a small basal tooth, prolateral lobe oval. Median apophysis index finger like in prolaterally view, tapering. Conductor bamboo leaf-shaped in ventral view (Fig. 58B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 3.02 (Figs 57A–B). Carapace 1.25 long, 0.90 wide. Opisthosoma 2.45 long, 1.38 wide. Clypeus 0.09 high. Leg measurements: I 8.67 (2.44, 0.33, 2.50, 2.01, 1.39); II 7.29 (2.10, 0.33, 2.08, 1.65, 1.13); III 7.22 (2.08, 0.35, 2.03, 1.63, 1.13); IV 7.30 (2.51, 0.33, 1.85, 1.56, 1.05). Vulva (Fig. 57C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Guizhou).

Description. Male (holotype). Total length 1.67 (Fig. 60A). Median apophysis absent, conductor reduced in prolaterally, 6 large spines retrolaterally, 3 large spines prolaterally, with 3 large spines prolaterally, 5 large spines retrolaterally, median apophysis not sclerotized, little finger-shaped in prolaterally view, conductor broad C tile-shaped (Fig. 60B) (tibia 60D), median apophysis not sclerotized, little finger-shaped in prolaterally view. Clypeus 0.13 high. Opisthosoma yellowish, ovoid. Leg measurements: I 9.96 (2.84, 0.35, 2.08, 2.40, 1.57); II 7.09 (2.02, 0.32, 2.00, 1.60, 1.15); III 6.38 (1.77, 0.32, 1.82, 1.47, 1.00); IV 7.89 (2.25, 0.35, 2.27, 1.85, 1.17). Male pedipalp (Figs 60C–D): Tibia with 4 spines prolaterally and 6 spines retrolaterally, with I spine longest. Cymbium not constricted, prolaterally with one curved spine on the base. Embolus triangular, prolateral lobe oval. Median apophysis slightly sclerotized, fingerlike in prolaterally view. Conductor broad, C tile-shaped in ventral view (Fig. 60B).

Female (one of the paratypes). Similar to male in color and general features, but larger and with shorter legs. Total length 2.12 (Figs 61A–B). Carapace yellow, ovoid. Leg measurements: I 9.79 (2.62, 0.35, 3.03, 2.22, 1.57); II 8.84 (1.90, 0.30, 1.97, 1.47, 1.20); III 5.53 (1.52, 0.32, 1.52, 1.27, 0.90); IV 7.36 (2.07, 0.35, 1.97, 1.72, 1.25). Clypeus 0.15 high. Leg measurements: I 8.26 (2.38, 0.38, 2.32, 1.88, 1.30); II 7.28 (2.05, 0.35, 2.00, 1.63, 1.25); III 6.47 (1.93, 0.35, 1.62, 1.47, 1.10); IV 7.54 (2.20, 0.38, 2.08, 1.75, 1.13). Vulva (Fig. 61C): spermathecae coiled, atrium fusiformed.

Distribution. China (Hubei).

**Leptonetela huoyuan Wang & Li sp. nov.**

Figs 62–63, 97

Type material. Holotype: male (IZCAS), Liuguan Cave, 26.15°N, 106.46°E, Mengqiu, Baiyunshan Town, Changshun County, Guizhou Province, China, 23 December 2010, Z. Zha & Z. Chen leg.

**Paratypes:** 2 female, same data as holotype; 1 male, Fenghuang Cave, 26.09°N, 106.39°E, Shenglian, Zhonghuo Town, Changshun County, Guizhou Province, China, 23 December 2010, Z. Zha & Z. Chen leg.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to **L. curvispinosa** Lin & Li, 2010, but can be distinguished by the male pedipalpal bulb median apophysis slightly sclerotized, fingerlike, conductor broad, semicircular (Fig 62B) (median apophysis absent in **L. anshun**, and **L. chenjia** Wang & Li sp. nov.; tip of conductor bifurcated in **L. anshun**, conductor reduced in **L. chenjia** Wang & Li sp. nov.); from **L. anshun** by the tibial I spine slender (Fig 62D) (tibial I spine strong, tip bifurcated in **L. anshun**).

**Description. Male (holotype).** Total length 2.25 (Fig 62A). Carapace 0.88 long, 0.83 wide. Opisthosoma 1.50 long, 0.92 wide. Carapace yellow. Eyes absent. Median groove, cervical groove and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma gray, ovoid. Leg measurements: I 8.90 (2.53, 0.40, 2.57, 2.00, 1.40); II 7.69 (2.38, 0.40, 2.13, 1.65, 1.13); III 6.51 (2.00, 0.38, 1.75, 1.50, 0.88); IV 7.73 (2.25, 0.40, 2.15, 1.78, 1.15). Male pedipalp (Figs 62C–D): Tibia with 4 large setae prolaterally, 1 long seta and 5 spines retrolaterally, with I spine longest, far apart from others, the rest spines concentrated distally. Cymbium constricted mediadly, attaching an earlobe-shaped process retrolaterally. Embolus triangular, prolateral lobe absent. Median apophysis slightly sclerotized, index finger like. Conductor broad, semicircular in ventral view (Fig. 62B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 2.53 (Figs 63A–B). Carapace 0.93 long, 0.82 wide. Opisthosoma 1.63 long, 1.38 wide. Clypeus 0.15 high. Leg measurements: I 8.26 (2.38, 0.38, 2.32, 1.88, 1.30); II 7.28 (2.05, 0.35, 2.00, 1.63, 1.25); III 6.47 (1.93, 0.35, 1.62, 1.47, 1.10); IV 7.54 (2.20, 0.38, 2.08, 1.75, 1.13). Vulva (Fig. 63C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Hubei).

**Leptonetela liuguan Wang & Li sp. nov.**

Figs 64–65, 97

Type material. Holotype: male (IZCAS), Liuguan Cave, 26.15°N, 106.46°E, Xiangping, Xianfeng County, Enshi Tujia and Miao Autonomous Prefecture, Hubei Province, China, 1 January 2014, Y. Li & Y. Lin leg.

**Paratypes:** 1 male and 2 females, same data as holotype; 1 male, Fenghuang Cave, 26.09°N, 106.39°E, Shenglian, Zhonghuo Town, Changshun County, Guizhou Province, China, 23 December 2010, Z. Zha & Z. Chen leg.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to **L. penevi** Wang & Li, 2016, **L. changtu** Wang & Li sp. nov. but can be distinguished by on the male pedipalpal bulb median apophysis long, and half the length of bulb (Fig. 64B) (median apophysis short, 1/5 the length of bulb in **L. palmate** and **L. changtu** Wang & Li sp. nov.); male pedipalpal tibia spines slender, equally strong (Fig. 64D) (tibial I II spines equally strong, stronger than others in **L. penevi**, tibial I II III spines equally strong, stronger than others in **L. changtu** Wang & Li sp. nov.).

**Description. Male (holotype).** Total length 1.88 (Fig. 64A). Carapace 0.73 long, 0.75 wide. Opisthosoma 1.10 long, 0.88 wide. Carapace yellowish. Eyes absent. Median groove, cervical...

grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma gray ovoid. Leg measurements: I 1.89 (2.38, 0.40, 2.64, 2.13, 1.38); II 7.84 (2.13, 0.40, 2.23, 1.78, 1.30); III 6.56 (1.75, 0.38, 1.80, 1.63, 1.00); IV 8.04 (2.25, 0.40, 2.18, 1.88, 1.33). Male pedipalp (Figs 64C–D): tibia with 3 long setae prolaterally, 5 slender spines retrolaterally, the spines slimy, equally strong. Embolus triangular, prolateral lobe absent. Teeth of median apophysis reduced to sclerotized spots, conductor and median apophysis long, equally length and half the length of bulb (Fig. 64C).

Female (one of the paratypes). Similar to male in color and general features, but larger and with shorter legs. Total length 2.08 (Figs 65A–B). Carapace 0.75 long, 0.75 wide. Opisthosoma 1.50 long, 0.88 wide. Clypeus 0.15 high. Leg measurements: I 7.81 (2.13, 0.38, 2.30, 1.75, 1.25); II 6.89 (1.88, 0.38, 2.00, 1.50, 1.13); III 5.97 (1.70, 0.38, 1.63, 1.38, 0.88); IV 7.27 (2.03, 0.38, 2.50, 1.63, 1.18). Vulva (Fig. 65C): spermathecae coiled, atrium fusiformed, anterior margin of atrium wavy line-shaped.

Distribution. China (Guizhou).

Leptonetela nanmu Wang & Li sp. nov.
Figs 66–67, 94

Type material. Holotype: male (IZCAS), Changjia Cave, 27.14°N, 105.43°E, Hanzhong, Nanxi Town, Bieji County, Guizhou Province, China, 23 November 2011, Z. Zha & Z. Zha leg. Paratypes: 1 male and 10 females, same data as holotype.

Etymology. The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to L. l i u g u a n Wang & Li, 2016, L. liuguan Wang & Li sp. nov. but can be distinguished by the male pedipalpal tibial II spines equally strong, stronger than others (Fig. 68C) (tibial I II spines equally strong, stronger than others in L. penevi, tibial spines slender, equally strong in L. liuguan Wang & Li sp. nov.); from L. changtu Wang & Li sp. nov. median apophysis short, 1/5 the length of bulb (Fig. 68B) (median apophysis long, half the length of bulb in L. liuguan Wang & Li sp. nov.); from L. penevi by the cymbium not constricted (cymbium constricted medially in L. penevi).

Description. Male (holotype). Total length 2.33 (Fig. 68A). Carapace 1.06 long, 1.03 wide. Opisthosoma 1.38 long, 1.08 wide. Carapace yellowish. Ocular area with a pair of setae, eyes absent. Median groove needle-shaped, brown. Cervical grooves and radial furrows indistinct. Clypeus 0.14 high. Opisthosoma pale yellow, ovoid, with brown spots. Leg measurements: I 10.02 (2.69, 0.39, 2.91, 2.38, 1.65); II 8.75 (2.37, 0.38, 2.49, 2.08, 1.43); III 7.53 (2.15, 0.38, 1.98, 1.77, 1.25); IV 9.20 (2.56, 0.38, 2.50, 2.26, 1.50). Male pedipalp (Figs 68C–D): tibia with 5 large spines retrolaterally, tibial I spine longest, I II spines equally strong, stronger than others. Cymbium not constricted. Embolus triangular, prolateral lobe oval. Median apophysis palm-shaped, teeth of median apophysis reduced to sclerotized spots. Conductor semicircular (Fig. 68B).

Female (one of the paratypes). Similar to male in color and general features, but larger and with shorter legs. Total length 2.70 (Figs 69A–B). Carapace 1.10 long, 0.88 wide. Opisthosoma 1.72 long, 1.48 wide. Clypeus 0.20 high. Leg measurements: I 9.10 (2.54, 0.43, 2.66, 1.98, 1.49); II 7.73 (2.21, 0.41, 2.21, 1.67, 1.23); III 6.85 (1.99, 0.40, 1.88, 1.50, 1.08); IV 8.22 (2.38, 0.41, 2.28, 1.88, 1.27). Vulva (Fig. 69C): spermathecae coiled, atrium triangular.

Distribution. China (Guizhou).

Leptonetela lianhua Wang & Li sp. nov.
Figs 70–71, 97

Type material. Holotype: male (IZCAS), Lianhua Cave, 25.48°N, 114.09°E, Niedou Town, Chongyi County, Jiangxi Province, China, 24 April 2013, Y. Luo & J. Liu leg. Paratypes: 3 males and 10 females, same data as holotype.

Etymology. The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to *L. niubizi* Wang & Li sp. nov. but can be distinguished by the male pedipalp tibia with 5 slender spines retrolaterally, I spine longest, not bifurcated (Fig. 72C), median apophysis EIK antler-like, distal edge decorated with 7 small teeth (Fig. 72B) (tibia with 5 spines retrolaterally, I spine strongest, tip bifurcated, the other 4 spines slender, 2 of them longer than I spine; tip of median apophysis decorated with 5 small teeth, and 1 ox horn-shaped large teeth in *L. lianhua* Wang & Li sp. nov.).

Description. Male (holotype). Total length 2.53 (Fig. 72A). Carapace 0.95 long, 0.83 wide. Opisthosoma 1.58 long, 1.13 wide. Carapace yellowish. Ocular area with a pair of setae, eyes absent. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.15 high. Opisthosoma gray, ovoid. Leg measurements: I 9.29 (2.56, 0.38, 2.63, 2.19, 1.53); II 8.63 (2.50, 0.38, 2.34, 2.03, 1.38); III 6.94 (2.03, 0.31, 1.47, 1.75, 1.38); IV - (2.55, 0.38, -). Male pedipalp (Figs 72C–D): tibia with 4 long setae retrolaterally, 2 long setae and 5 slender spines retrolaterally, with I spine longest. Cymbium constricted medially, attaching a small earlobe-shaped process retrolaterally. Embolus triangular, prolateral lobe oval. Median apophysis EIK antler-like, distal edge decorated with 7 small teeth. Conductor short, C tile-shaped (Fig. 72B).

Female (one of the paratypes). Similar to male in color and general features, but with a larger body size and shorter legs. Total length 2.60 (Figs 73A–B). Carapace 0.96 long, 0.95 wide. Opisthosoma 1.60 long, 1.25 wide. Clypeus 0.19 high. Leg measurements: I 8.20 (2.34, 0.34, 2.44, 1.75, 1.33); II 7.46 (2.25, 0.38, 1.88, 1.65, 1.30); III 6.08 (2.05, 0.30, 1.08, 1.55, 1.10); IV 8.27 (2.38, 0.38, 2.25, 1.88, 1.38). Vulva (Fig. 73C): spermathecae coiled, atrium triangular.

Distribution. China (Guizhou).

Leptonetela longyu Wang & Li sp. nov.
Figs 74–75, 97

Type material. Holotype: male (IZCAS), Longyu Cave, 29.40°N, 110.09°E, Cili County, Hunan Province, China, 5 June 2011, Z. Zha leg. Paratypes: 4 males and 5 females, same data as holotype, 5 males and 6 females, Niuerduo Cave, 29.40°N, 110.73°E, Cili County, Hunan Province, China, 9 April 2016, Y. Li & Z. Chen leg.

Etymology. The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to *L. sexdentata* Wang & Li sp. nov.; from *L. meiwang* Wang & Li sp. nov. 5 sharp teeth in *L. meiwang* Wang & Li sp. nov. and 10 in *L. shicheng* Wang & Li sp. nov.; from *L. shicheng* Wang & Li sp. nov. by the tip of conductor wavy

line-shaped (Fig. 74B) (tip of conductor smooth in *L. shicheng* Wang & Li sp. nov.); from *L. zakou* Wang & Li sp. nov. by the teeth of median apophysis needle-shaped in *L. zakou* Wang & Li sp. nov.; from *L. meiwang* Wang & Li sp. nov. by the tibial I spine strongest, tip asymptomatically bifurcated (tibial II spine strongest in *L. meiwang* Wang & Li sp. nov.).

**Description. Male (holotype).** Total length 1.63 (Fig. 74A). Carapace 1.05 long, 0.75 wide. Opisthosoma 0.88 long, 0.63 wide. Carapace yellow. Eyes six. Median groove needle-shaped, cervical grooves and radial furrows distinct. Clypeus 0.13 high. Opisthosoma gray, ovoid. Leg measurements: I 6.28 (1.63, 0.25, 1.85, 1.55, 1.00); II 4.89 (1.25, 0.25, 1.38, 1.13, 0.88); III 4.13 (1.10, 0.23, 1.05, 1.00, 0.75); IV 5.63 (1.55, 0.25, 1.50, 1.38, 0.95). Male pedipalp (Figs 74C–D): tibia with 2 spines prolaterally and 5 spines retrolaterally, with I spine strongest, tip asymptomatically bifurcated. Clypium constricted medially, attaching a small earlobe-shaped process retrolaterally. Embolus triangular, prolateral lobe indistinct. Median apophysis short, palmated, distal edge with 5 small teeth. Conductor C tile-shaped in ventral view, tip of conductor wavy line-shaped (Fig. 74B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with longer legs. Total length 2.05 (Figs 75A–B). Carapace 0.90 long, 0.75 wide. Opisthosoma 1.13 long, 0.88 wide. Clypeus 0.12 high. Leg measurements: I 6.28 (1.75, 0.25, 1.88, 1.40, 1.00); II 4.94 (1.30, 0.25, 1.38, 1.13, 0.88); III 4.41 (1.25, 0.23, 1.13, 1.05, 0.75); IV 5.58 (1.60, 0.25, 1.50, 1.35, 0.88). Vulva (Fig. 75C): spermathecae coiled, atrium triangular.

**Distribution.** China (Hunan).

*Leptonetela shicheng* Wang & Li sp. nov.
Figs 76–77, 97

**Type material. Holotype:** male (IZCAS), Shicheng Cave, 27.31°N, 109.07°E, Jiangwu, Shanshi Town, Lianhua County, Pingxiang City, Jiangxi Province, China, 14 November 2015, Z. Chen & G. Zhou leg. **Paratypes:** 2 males and 5 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. sexdentata* Wang & Li, 2011, *L. longyu* Wang & Li sp. nov., *L. zakou* Wang & Li sp. nov. and *L. meiwang* Wang & Li sp. nov. but can be distinguished by on the male pedipalp bulb median apophysis harrow-like, with 10 small teeth distally (Fig. 76B) (median apophysis with 6 small teeth distally in *L. sexdentata* and *L. zakou* Wang & Li sp. nov., 5 in *L. longyu* Wang & Li sp. nov., and *L. meiwang* Wang & Li sp. nov.); conductor smooth (Fig. 76B) (conductor wavy line-shaped distally in *L. sexdentata*, *L. longyu* Wang & Li sp. nov., and *L. zakou* Wang & Li sp. nov.); from *L. zakou* Wang & Li sp. nov. by the teeth of median apophysis needle-shaped in *L. zakou* Wang & Li sp. nov.; from *L. meiwang* Wang & Li sp. nov. by the tibial I spine strongest, tip asymptomatically bifurcated (Fig. 76D) (tibial II spine strongest in *L. meiwang* Wang & Li sp. nov.).

**Description. Male (holotype).** Total length 2.40 (Fig. 76A). Carapace 1.00 long, 0.73 wide. Opisthosoma 1.12 long, 0.87 wide. Carapace yellowish. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.08 high. Opisthosoma gray, ovoid. Leg measurements: I 9.60 (2.60, 0.37, 2.50, 2.48, 1.65); II 7.90 (2.25, 0.30, 2.25, 2.00, 1.40); III 6.87 (1.75, 0.25, 1.87, 1.75, 1.25); IV 8.92 (2.37, 0.30, 2.50, 2.25, 1.50). Male pedipalp (Figs 76C–D): tibia 2 long setae prolaterally, and 5 spines retrolaterally, with I spine strongest, tip asymptomatically bifurcated. Clypium constricted medially, attaching a small earlobe-shaped process retrolaterally. Embolus triangular, prolateral lobe indistinct. Median apophysis harrow-like, with 10 small teeth distally. Conductor smooth, C tile-shaped in ventral view (Fig. 76B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 2.60 (Figs 77A–B). Carapace 0.87 long, 0.85 wide. Opisthosoma 1.75 long, 1.25 wide. Clypeus 0.15 high. Leg measurements: I 8.94 (2.60, 0.37, 2.50, 2.10, 1.37); II 7.10 (2.00, 0.30, 2.00, 1.65, 1.15); III 5.97 (1.75, 0.25, 1.60, 1.50, 0.87); IV 7.97 (2.12, 0.35, 2.25, 2.00, 1.25). Vulva (Fig. 77C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Jiangxi).

*Leptonetela zakou* Wang & Li sp. nov.
Figs 78–79, 97

**Type material. Holotype:** male (IZCAS), Zakou Cave, 29.35°N, 109.58°E, Hongyanxi Town, longshan City, Hunan Province, China, 10 January 2016, Z. Chen & Z. Wang leg. **Paratypes:** 3 males and 5 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. sexdentata* Wang & Li, 2011, *L. longyu* Wang & Li sp. nov., *L. shicheng* Wang & Li sp. nov., and *L. meiwang* Wang & Li sp. nov. but can be distinguished by on the male pedipalp bulb median apophysis with 5 teeth, needle-shaped (Fig. 78B) (median apophysis with 6 small teeth distally in *L. sexdentata* and *L. zakou* Wang & Li sp. nov., 5 sharp teeth in *L. meiwang* Wang & Li sp. nov., and 10 in *L. shicheng* Wang & Li sp. nov.); from *L. shicheng* Wang & Li sp. nov. by the conductor wavy line-shaped distally (Fig. 78B) (conductor smooth in *L. shicheng* Wang & Li sp. nov.); from *L. meiwang* Wang & Li sp. nov. by the tibial I spine strongest, tip asymptomatically bifurcated (Fig. 78D) (tibial II spine strongest in *L. meiwang* Wang & Li sp. nov.).

**Description. Male (holotype).** Total length 1.75 (Fig. 78A). Carapace 0.87 long, 0.87 wide. Opisthosoma 1.00 long, 0.87 wide. Carapace yellowish. Ocular area with a pair of setae,

eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.08 high. Opisthosoma gray, ovoid. Leg measurements: I 7.62 (2.00, 0.25, 2.37, 1.75, 1.25); II 5.62 (1.50, 0.25, 1.62, 1.25, 1.00); III 4.57 (1.25, 0.20, 1.30, 1.12, 0.70); IV 6.47 (1.87, 0.25, 1.75, 1.50, 1.10). Male pedipalp (Figs 78C–D): tibia with 3 long setae prolaterally, 5 large spines retrorlaterally, with I spine strongest, tip asymmetrically bifurcated. Cymbium not constricted, earlobe-shaped process absent. Embolus triangular, prolateral lobe absent. median apophysis with 6 needle-shaped teeth distally. Conductor C tile-shaped in ventral view (Fig. 78B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 1.70 (Figs 79A–B). Carapace 0.87 long, 0.80 wide. Opisthosoma 1.27 long, 0.75 wide. Clypeus 0.15 high. Leg measurements: I 6.49 (1.75, 0.25, 1.72, 1.50, 1.27); II 4.69 (1.37, 0.25, 1.27, 1.00, 0.80); III 3.74 (1.12, 0.20, 1.00, 0.80, 0.62); IV 5.30 (1.50, 0.25, 1.50, 1.30, 0.75). Vulva (Fig. 79C): spermathecae coiled, atrium fusiformed, anterior margin of atrium with one mastoid process medially.

**Distribution.** China (Guizhou).

*Leptonetela meiwinag* Wang & Li sp. nov.

**Figs 80–81, 97**

**Type material.** Holotype: male (IZCAS), Meiwinag Cave, 28.09°N, 111.43°E, Nanhua, Zhengshang Town, Ludi County, Hunan Province, China, 27 March 2016, Y. Li & Chen. Z leg.

**Paratypes:** 1 male and 1 female, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. sexdentata* Wang & Li, 2011, *L. longyu* Wang & Li sp. nov. *L. shicheng* Wang & Li sp. nov. and *L. zakou* Wang & Li sp. nov.; but can be distinguished by on the male pedipalpal bulb median apophysis with 4 teeth distally (Fig. 82B) (median apophysis with 6 teeth distally in *L. arvanitidisi*, 3 teeth in *L. paragamiani* and 5 teeth in *L. erlong* Wang & Li sp. nov.); tibial I spine strongest, tip asymmetrically bifurcated, II, III spines equally strong, stronger than other 2 (Fig. 82C) (tibial II–V spines slender, curved, and equally strong in *L. arvanitidisi* and *L. erlong* Wang & Li sp. nov., tibial III–V spines equally strong, slender than II spine in *L. paragamiani*); from *L. sexdentata* by the conductor C tile-shaped (Fig. 82B) (conductor triangular in *L. arvanitidisi*).

**Description.** Male (holotype): total length 1.75 (Fig. 80A). Prosoma 0.70 long, 0.62 wide. Opisthosoma 1.20 long, 0.70 wide. Carapace yellowish. Ocular area with a pair of setae, eyes absent. Median groove needle shaped, cervical grooves and radial furrows indistinct. Clypeus 0.08 high. Opisthosoma gray, ovoid. Leg measurements: I 9.8 (2.50, 0.37, 2.81, 2.50, 1.62); II 8.44 (2.30, 0.35, 2.30, 2.12, 1.37); III 7.77 (2.25, 0.30, 2.12, 2.10, 1.00); IV 9.61 (2.50, 0.37, 2.50, 2.37, 1.87). Male pedipalp (Figs 80C–D): tibia with 5 spines retrorlaterally, with II spine strongest. Cymbium constricted at middle, earlobe-shaped process absent. Embolus triangular, prolateral lobe indistinct. median apophysis with 5 sharp teeth distally. Conductor short, reduced (Fig. 80B).

**Female.** Similar to male in color and general features, but larger and with shorter legs. Total length 1.75 (Figs 81A–B). Prosoma 0.75 long, 0.62 wide. Opisthosoma 1.00 long, 0.75 wide. Clypeus 0.20 high. Leg measurements: I 8.13 (2.37, 0.34, 2.30, 1.75, 1.37); II 7.54 (2.25, 0.34, 2.00, 1.70, 1.25); III 6.62 (1.87, 0.30, 1.75, 1.50, 1.20); IV 7.69 (2.30, 0.34, 2.30, 1.75, 1.37). Vulva (Fig. 81C): spermathecae coiled, atrium triangular.

**Distribution.** China (Hunan).

*Leptonetela tawo Wang & Li sp. nov.

**Figs 82–83, 97**

**Type material.** Holotype: male (IZCAS), Xianren Cave, 29.18°N, 109.95°E, Xianren, Tawo Town, Yongshun County, Hunan Province, China, 14 January 2016, Z. Chen & Z. Wang leg.

**Paratypes:** 2 males and 2 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. arvanitidisi* Wang & Li, 2016, *L. paragamiani* Wang & Li, 2016 and *L. erlong* Wang & Li sp. nov. but can be distinguished by on the male pedipalpal bulb median apophysis with 4 teeth distally (Fig. 82B) (median apophysis with 6 teeth distally in *L. arvanitidisi*, 3 teeth in *L. paragamiani* and 5 teeth in *L. erlong* Wang & Li sp. nov.); tibial I spine strongest, tip asymmetrically bifurcated, II, III spines equally strong, stronger than other 2 (Fig. 82C) (tibial II–V spines slender, curved, and equally strong in *L. arvanitidisi* and *L. erlong* Wang & Li sp. nov., tibial III–V spines equally strong, slender than II spine in *L. paragamiani*); from *L. arvanitidisi* by the conductor C tile-shaped (Fig. 82B) (conductor triangular in *L. arvanitidisi*).

**Description.** Male (holotype): total length 1.90 (Fig. 82A). Carapace 0.87 long, 0.75 wide. Opisthosoma 1.25 long, 0.87 wide. Carapace yellowish. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.08 high. Opisthosoma gray, ovoid. Leg measurements: I 7.69 (2.00, 0.35, 2.37, 1.72, 1.25); II 5.95 (1.75, 0.30, 1.55, 1.35, 1.00); III 4.60 (1.25, 0.25, 1.15, 1.00); IV 7.15 (1.85, 0.30, 2.25, 1.60, 1.15). Male pedipalp (Figs 82C–D): tibia with 4 long setae prolaterally, 5 large spines retrorlaterally, with I spine strongest, tip asymmetrically bifurcated, II, III tibia spines equally strong, stronger than other 2. Cymbium not constricted, earlobe-shaped process absent. Embolus triangular, prolateral lobe indistinct. median apophysis with 4 teeth distally. Conductor C tile-shaped in ventral view (Fig. 82B).

**Female (one of the paratypes).** Similar to male in color and general features, but larger and with shorter legs. Total length 1.90 (Fig. 83A). Carapace 0.87 long, 0.75 wide. Opisthosoma 1.25 long, 0.87 wide. Carapace yellowish. Ocular area with a pair of setae, eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.08 high. Opisthosoma gray, ovoid. Leg measurements: I 7.77 (2.30, 0.35, 2.30, 2.12, 1.37); II 7.88 (2.30, 0.35, 2.30, 2.12, 1.37); III 7.88 (2.30, 0.35, 2.30, 2.12, 1.37); IV 9.61 (2.50, 0.37, 2.50, 2.37, 1.87). Male pedipalp (Figs 83C–D): tibia with 5 spines retrorlaterally, with II spine strongest. Cymbium constricted at middle, earlobe-shaped process absent. Embolus triangular, prolateral lobe indistinct. median apophysis with 5 sharp teeth distally. Conductor short, reduced (Fig. 83B).

Distribution. China (Hunan).

**Leptonetela dabian** Wang & Li sp. nov.

Figs 86–87, 97

Type material. Holotype: male (IZCAS), Wuming Cave, 25.75°N, 107.92°E, Dabian, Sandong Town, Sandu County, Qiannan Prefecture, Guizhou, China, 22 March 2013, H. Zhao & J. Liu. Paratypes: 2 females, same data as holotype.

Etymology. The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to *L. thracia* Wang & Li, 2011, *L. chuan* Wang & Li sp. nov., but can be distinguished by the male pedipalpal tibia with 3 spines prolaterally, 5 slender spines, retrolaterally (Figs 86C–D) (tibia with 4 long setae prolaterally, 5 large spines retrolaterally, I, II spines equally strong, stronger than others in *L. thracia*; tibia with 7 long setae prolaterally, 5 large spines retrolaterally, I, II, III spines equally strong, stronger than others in *L. chuan* & Li sp. nov.); tip of median apophysis bend upwards, with 3 larger teeth distally (Fig. 86B) (tip of median apophysis bend downwards, with 5 larger teeth distally in *L. chuan* & Li sp. nov.); tip of median apophysis not bend, with 4 teeth distally in *L. thracia*); conductor thin, tongue shaped (Fig. 86B) (conductor triangular in *L. thracia* and *L. chuan* & Li sp. nov.).

Description. Male (holotype). Total length 2.38 (Fig. 86A). Carapace 1.00 long, 0.80 wide. Opisthosoma 1.25 long, 0.90 wide. Carapace yellow. Eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma yellowish. Eyes absent. Median groove needle-shaped, brown. Cervical grooves and radial furrows indistinct. Clypeus 0.13 high, slightly sloped anteriorly. Opisthosoma pale brown, ovoid, covered with short hairs, lacking distinctive pattern. Sternum and legs yellowish. Leg measurements: I 6.81 (2.35, 0.35, 1.87, 1.37, 0.87); II 5.82 (2.25, 0.35, 1.35, 1.07, 0.80); III 5.22 (2.20, 0.30, 1.00, 0.97, 0.75); IV 6.30 (2.30, 0.35, 1.50, 1.30, 0.85). Male pedipalp (Figs 84C–D): tibia with 5 spines retrolaterally, with 1 spine strongest, tip asymmetrically bifurcated, tibial II–V spines slender, curved, and equally strong. Cymbium constricted medially, earlobe-shaped process small. Embolus triangular, prolateral lobe indistinct. Median apophysis with 5 teeth distally. Conductor C tile-shaped in ventral view (Fig. 84B).

Female (one of the paratypes). Similar to male in color and general features, but larger and with shorter legs. Total length 2.30 (Figs 85A–B). Prosoma 0.85 long, 0.95 wide. Opisthosoma 0.87 long, 0.70 wide. Clypeus 0.20 high. Leg measurements: I 8.60 (2.50, 0.35, 2.20, 1.80, 1.75); II 7.65 (2.35, 0.30, 1.95, 1.70, 1.35); III 6.30 (2.15, 0.25, 2.05, 1.15, 0.70); IV 7.85 (2.25, 0.30, 2.05, 1.75, 1.50). Vulva (Fig. 85C): spermathecae coiled, atrium fusiformed.

Distribution. China (Guizhou).

**Leptonetela chuan** Wang & Li sp. nov.

Figs 88–89, 97

Type material. Holotype: male (IZCAS), Chuan Cave, 27.08°N, 105.67°E, Yangchangba Town, Dafang County, Guizhou Province, China (Hunan).

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to *L. thracia* Wang & Li, 2011, *L. dabian* Wang & Li sp. nov., but can be distinguished by the male pedipalpal tibia with 7 long setae prolaterally, 5 slender spines retrolaterally, with I, II, III spines equally strong, stronger than others (Fig. 88D) (tibia with 4 long setae prolaterally, 5 slender spines retrolaterally, with I, II spines equally strong, stronger than others in *L. thracia*; 3 slender spines prolaterally, 5 slender retrolaterally spines equally strong in *L. dabian* Wang & Li sp. nov.); tip of median apophysis bend downwards, with 5 larger teeth distally (Fig. 88B) (tip of median apophysis not bend, with 4 teeth distally in *L. thracia*; tip of median apophysis bend upwards, with 3 larger teeth distally in *L. dabian* Wang & Li sp. nov.); from *L. dabian* Wang & Li sp. nov. by the conductor triangular (Fig. 88B) (conductor thin, tongue-shaped in *L. dabian* Wang & Li sp. nov.).

**Description.** Male (holotype).

Carapace 0.83 long, 0.90 wide. Opisthosoma 1.18 long, 1.05 wide. Carapace whitish. Ocular area with a pair of setae, eyes absent. Median groove, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma gray, ovoid. Leg measurements: I 8.79 (2.38, 0.38, 2.50, 2.13, 1.40); II 7.77 (2.13, 0.38, 2.18, 1.78, 1.30); III 7.51 (1.78, 0.35, 2.10, 1.73, 1.55); IV 8.36 (2.25, 0.38, 2.38, 2.00, 1.35). Male pedipalp (Figs 88C–D): tibia with 7 long setae prolaterally, 5 large spines retrolaterally, with I, II, III spines equally strong, stronger than others. Cymbium constricted medially, attaching a small earlobe-shaped process retrolaterally. Embolus triangular, prolaral lobe oval. Median apophysis bend downwards, with 5 larger teeth distally. Conductor triangular in ventral view (Fig. 88B).

Female: Similar to male in color and general features, but smaller and with shorter legs. Total length 2.08 (Figs 89A–B). Carapace 0.78 long, 0.88 wide. Opisthosoma 1.33 long, 1.03 wide. Clypeus 0.15 high. Leg measurements: I 8.31 (2.33, 0.38, 2.40, 1.85, 1.35); II 7.21 (2.10, 0.35, 2.08, 1.58, 1.10); III 6.92 (1.93 0.35, 1.88, 1.63, 1.13); IV 8.14 (2.30, 0.38, 2.38, 1.83, 1.25). Vulva (Fig. 89C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Guangxi).

*Leptonetela lihu* Wang & Li sp. nov. Figs 90–91, 97

**Type material.** Holotype: male (IZCAS), nameless Cave, 25.10°N, 107.65°E, Lihu Town, Nandan County, Hechi City, Guangxi Zhuang Autonomous Region, China, 31 January 2015, Y. Li & Z. Chen leg. Paratypes: 2 males and 5 females, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

Diagnosis. This new species is similar to *L. notabilis* (Lin & Li, 2010), *L. sexdigiti* (Lin & Li, 2010), and *L. shuang* Wang & Li sp. nov., but can be separated from *L. notabilis* by the male pedipalpal tibial I spine bifurcate (Fig. 90D) (tibial I spine trifurcate in *L. notabilis*); from *L. shuang* Wang & Li sp. nov. by the conductor C tile-shaped, distal edge of median apophysis with 6 teeth (Fig. 90B) (conductor triangular, distal edge of median apophysis with 7 teeth in *L. shuang* Wang & Li sp. nov.); from *L. sexdigiti* by in the female spermathecae strongly twisted (spermathecae loosely twisted in *L. sexdigiti*).

**Description.** Male (holotype). Total length 2.13 (Fig. 90A). Carapace 1.00 long, 0.88 wide. Opisthosoma 1.12 long, 0.75 wide. Carapace yellowish. Ocular area with 3 long setae, eyes six, reduced to white spots. Median groove needle-shaped, cervical grooves and radial furrows distinct. Clypeus 0.13 high. Opisthosoma gray, ovoid. Leg measurements: I 8.23 (2.25, 0.25, 2.38, 1.95, 1.40); II 7.00 (2.00, 0.25, 2.00, 1.63, 1.12); III 6.10 (1.75, 0.20, 1.75, 1.45, 0.95); IV 7.75 (2.10, 0.25, 2.25, 1.90, 1.25). Male pedipalp (Figs 90C–D): basal of tibia swollen, tibia with 5 spines retrolaterally, with 1 spine strongest, longest, bifurcate and located at the base of tibia. Cymbium constricted medially, attaching a small earlobe-shaped process retrolaterally. Embolus triangular, prolaral lobe oval. Median apophysis long and thin, with 6 small teeth distally. Conductor broad, C tile-shaped in ventral view (Fig. 90B).

Female (one of the paratypes). Similar to male in color and general features, but larger and with shorter legs. Total length 2.50 (Figs 91A–B). Carapace 1.25 long, 0.75 wide. Opisthosoma 1.40 long, 1.00 wide. Clypeus 0.12 high. Leg measurements: I 8.00 (2.25, 0.25, 2.38, 1.75, 1.37); II 7.00 (2.00, 0.25, 2.00, 1.50, 1.25); III 5.65 (1.75, 0.20, 1.65, 1.15, 0.90); IV 7.70 (2.10, 0.25, 2.25, 1.90, 1.20). Vulva (Fig. 91C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Guangxi).

*Leptonetela shuang* Wang & Li sp. nov. Figs 92–93, 97

**Type material.** Holotype: male (IZCAS), Shuang Cave, 25.93°N, 107.26°E, Bailong Town, Pingtang County, Qiannan Prefecture, Guizhou Province, China, 24 July 2012, H. Zhao leg. Paratypes: 2 females, same data as holotype; 2 males and 6 females, Dongkou Cave, 25.93°N, 107.25°E, Longxiang, Bailong Town, Pingtang County, Qiannan Prefecture, Guizhou Province, China, 25 July 2012, H. Zhao leg.

**Etymology.** The specific name refers to the type locality; noun.

with 7 teeth (Fig. 92B) (conductor C tile-shaped, distal edge of median apophysis with 6 teeth in L. sexdigiti and L. lihu Wang & Li sp. nov.); from L. sexdigiti by in the female spermathecae strongly twisted (Fig. 93C) (spermathecae loosely twisted in L. sexdigiti).

**Description. Male (holotype).** Total length 2.00 (Fig. 92A). Carapace 0.83 long, 0.75 wide. Opisthosoma 1.25 long, 0.80 wide. Carapace yellow. Ocular area with a pair of setae, eyes absent. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.13 high. Opisthosoma whitish, ovoid. Leg measurements: I 7.74 (2.03, 0.38, 2.25, 1.80, 1.28); II 6.65 (1.77, 0.35, 1.83, 1.50, 1.20); III 5.68 (1.57, 0.35, 1.50, 1.28, 0.98); IV 7.38 (1.92, 0.38, 2.05, 1.78, 1.25). Male pedipalp (Figs 92C–D): basal of tibia swollen, tibia with 3 long setae prolaterally, with I spine strongest, longest, bifurcate and located at the base of tibia. Cymbium constricted medially, attaching a small earlobe-shaped process retrolaterally. Embolus triangular, prolateral lobe oval. Median apophysis harrow-like, distal edge round, decorated with 8 small teeth. Conductor triangular in ventral view (Fig. 94B).

**Female (one of the paratypes).** Similar to male in color and general features, but smaller and with shorter legs. Total length 1.98 (Figs 93A–B). Carapace 0.88 long, 0.75 wide. Opisthosoma 1.13 long, 0.88 wide. Clypeus 0.13 high. Leg measurements: I 7.34 (1.93, 0.38, 2.13, 1.65, 1.25); II 6.41 (1.75, 0.35, 1.78, 1.50, 1.03); III 5.50 (1.52, 0.35, 1.45, 1.30, 0.88); IV 7.03 (1.87, 0.38, 2.05, 1.63, 1.10). Vulva (Fig. 93C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Guizhou).

**Leptonetela encun Wang & Li sp. nov. Figs 94–95, 97**

**Type material.** Holotype: male (IZCAS), Encun Cave, 25.08°N, 107.59°E, En, Chengguan Town, Nandan County, Hechi City, Guangxi Zhuang Autonomous Region, China, 30 Jan 2015, Y. Li & Z. Chen leg. **Paratypes:** 1 male and 1 female, same data as holotype.

**Etymology.** The specific name refers to the type locality; noun.

**Diagnosis.** This new species is similar to L. robustispina (Chen et al., 2010) but can be distinguished by the male pedipalpal tibia with 5 spines retrolaterally, with I spine longest, I, II, III spines equally strong, longer than others (Fig. 94D), distal edge of median apophysis linear-shaped, with 8 teeth (Fig. 94B) (tibia with 5 spines retrolaterally, with I spine longest, distal edge of median apophysis semicircular, with 12 teeth in L. robustispina).

**Description. Male (holotype).** Total length 2.00 (Fig. 94A). Carapace 0.90 long, 0.75 wide. Opisthosoma 1.25 long, 0.88 wide. Carapace yellowish, with one seta on the median part. Eyes six. Median groove needle-shaped, cervical grooves and radial furrows indistinct. Clypeus 0.10 high. Opisthosoma gray, ovoid. Leg measurements: I - (1.88, - , - , - , -); II 6.25 (1.75, 0.25, 1.87, 1.38, 1.00); III 4.96 (1.38, 0.20, 1.38, 1.20, 0.80); IV 6.86 (2.00, 0.25, 1.88, 1.63, 1.10). Male pedipalp (Figs 94C–D): tibia with a few clusters of short spines dorsally, 8 long setae retrolaterally, and 5 spines retrolaterally, spine I longest. Cymbium constricted medially, attaching a small earlobe-shaped process retrolaterally. Embolus triangular, prolateral lobe indistinct. Median apophysis harrow-like, distal edge round, decorated with 8 small teeth. Conductor triangular in ventral view (Fig. 94B).

**Female: Similar to male in color and general features, but larger and with shorter legs. Total length 2.13 (Figs 95A–B). Carapace 0.88 long, 0.75 wide. Opisthosoma 1.00 long, 1.05 wide. Clypeus 0.11 high. Leg measurements: I 6.50 (1.75, 0.25, 2.00, 1.50, 1.00); II 5.01 (1.38, 0.25, 1.50, 1.13, 0.75); III 4.45 (1.25, 0.20, 1.25, 1.00, 0.75); IV 5.52 (1.50, 0.25, 1.62, 1.25, 0.90). Vulva (Fig. 95C): spermathecae coiled, atrium fusiformed.

**Distribution.** China (Guangxi).

**Leptonetela zhai Wang & Li, 2011 Figs 96, 97**

**Leptonetela zhai Wang & Li, 2011:** 17, figs 69A–D, 70A–B, 71C–D.

**Material examined.** 4 female (IZCAS), Rudong Cave, 25.57°N, 110.62°E, Longpan Mountain, Dongtian, Hucheng Town, Xing’an County, Guilin City, Guangxi Zhuang Autonomous Region, China, 08 Nov 2012, Z. Chen & Z. Zhao leg.

**Description. Male.** See Wang & Li (2011).

**Female.** Total length 2.12 (Figs 96A–B). Carapace 0.80 long, 0.73 wide. Opisthosoma 1.27 long, 0.85 wide. Clypeus 0.12 high. Leg measurements: I 6.61 (1.62, 0.37, 1.65, 1.87, 1.10); II 5.39 (1.77, 0.30, 1.25, 1.12, 0.95); III 4.16 (1.12, 0.27, 1.02, 1.00, 0.75); IV 5.72 (1.50, 0.30, 1.55, 1.35, 1.02). Vulva (Fig. 96C): spermathecae coiled, atrium fusiformed, anterior margin of atrium with short hairs.

**Distribution.** China (Guangxi).

**Remarks.** Female of the species is reported for the first time. Female of Leptonetela zhai were collected from the same cave of holotype male L. zhai Wang & Li, 2011.

**Leptonetela tianxinensis (Tong & Li, 2008) comb. nov.**

**Leptonetela tianxinensis Tong & Li, 2008:** 382, figs 5A–G (♀♂).

**Type material examined.** Paratypes: 12 males, 6 females (IZCAS), Tianxin Cave, 33.35°N, 111.88°E, Sandaolohe, Qilipo Town, Neixiang County, Henan Province, China, 24 Jun 2005, Q. Wang & Y. Tong leg.

A: Habitus, dorsal view; B: Habitus, ventral view; C: Spermatheca, dorsal view.
FIGURE 97 Locality records for forty-six new species of Leptonetela in China
1: L. chakou sp. nov. (Sichuan, China); 2: L. changtu sp. nov. (Guizhou, China); 3: L. chenjia sp. nov. (Guizhou, China); 4: L. chuan sp. nov. (Guizhou, China); 5: L. dabian sp. nov. (Guizhou, China); 6: L. dao sp. nov. (Guizhou, China); 7: L. dashui sp. nov. (Guizhou, China); 8: L. encun sp. nov. (Guizhou, China); 9: L. erlong sp. nov. (Hunan, China); 10: L. feilong sp. nov. (Guizhou, China); 11: L. gang sp. nov. (Guizhou, China); 12: L. gubin sp. nov. (Guizhou, China); 13: L. huoyan sp. nov. (Hubei, China); 14: L. jihe sp. nov. (Guangxi, China); 15: L. kangsia sp. nov. (Guizhou, China); 16: L. la sp. nov. (Guizhou, China); 17: L. langdong sp. nov. (Guizhou, China); 18: L. liantung sp. nov. (Guizhou, China); 19: L. lihu sp. nov. (Guangxi, China); 20: L. lijuan sp. nov. (Guizhou, China); 21: L. liuchui sp. nov. (Guizhou, China); 22: L. longli sp. nov. (Guizhou, China); 23: L. longyu sp. nov. (Hunan, China); 24: L. lujia sp. nov. (Guizhou, China); 25: L. meiwang sp. nov. (Hunan, China); 26: L. mayang sp. nov. (Guizhou, China); 27: L. niubizi sp. nov. (Guizhou, China); 28: L. panbao sp. nov. (Guizhou, China); 29: L. shancheng sp. nov. (Guizhou, China); 30: L. shcheng sp. nov. (Guizhou, China); 31: L. shuang sp. nov. (Hunan, China); 32: L. shuangli sp. nov. (Guizhou, China); 33: L. sanyan sp. nov. (Guangxi, China); 34: L. shanxi sp. nov. (Guizhou, China); 35: L. tawo sp. nov. (Hunan, China); 36: L. tiankeng sp. nov. (Guizhou, China); 37: L. wuming sp. nov. (Guizhou, China); 38: L. xianren sp. nov. (Hunan, China); 39: L. xihua sp. nov. (Guangxi, China); 40: L. xiaoyan sp. nov. (Guizhou, China); 41: L. xishui sp. nov. (Guizhou, China); 42: L. zao sp. nov. (Guizhou, China); 43: L. zhoujia sp. nov. (Guizhou, China); 44: L. zhongzi sp. nov. (Guizhou, China); 45: L. zhongzi sp. nov. (Guizhou, China); 46: L. zhuxi sp. nov. (Guizhou, China).

Remarks. Our studies showed that this species should be transferred to the genus Leptonetela, based on the result of DNA barcoding and the morphology characters that the pedipalpal femur spineless, tibia with one strong spine retrolaterally.

Leptonetela gigachela (Lin & Li, 2010) comb. nov.

Guineta gigachela Lin & Li, 2010: 6, figs 1A, 2A–E, 3A–B (♀♀).

Remarks. Our studies showed that that Guineta Lin & Li, 2010 syn. nov. should be a junior synonym of Leptonetela Kratochvíl, 1978.

Leptonetela notabilis (Lin & Li, 2010) comb. nov.

Type material. Holotype: male (IZCAS), Hebiandong Cave, Kaixi Town, Duyun City, 26.00°N, 107.20°E, Guizhou Province, China, 8 May 2006, Y. Li leg. Paratypes: 1 male and 1 female, same data as holotype.

Remarks. Our studies showed that Sinoneta Lin & Li, 2010 syn. nov. should be a junior synonym of Leptonetela Kratochvil, 1978.

Leptonetela sexdigitili (Lin & Li, 2010) comb. nov.

Sinoneta sexdigitili Lin & Li, 2010: 87, figs 58A–B, 59A–B, 60A–B (♀♂). Material examined. In this study our results confirmed that, Lin leg.

Material examined. 1 male and 1 female (IZCAS), Sanchahe Cave, 26.53°N, 107.70°E, Sanchahe, Jialiang Town, Libo County, Guizhou Province, China, 16 May 2011, C. Wang & L. Lin leg. Remarks. Qianleptoneta palmata was collected from Sanchahe Cave in Guizhou, China and published by Chen et al at December 2010. Wang & Li (2011) transferred Qianleptoneta palmata Chen et al, 2010 to the genus Sinoneta Lin & Li, 2010. Nevertheless, in this study our results confirmed that Qianleptoneta palmata belonged to the genus Leptonetela.

Leptonetela palmata is a preoccupied name for a species collected from Dixian Cave in Guizhou, China and published by Lin & Li, at August 2010. Consequently, Leptonetela sanchahe nom. nov. is proposed for the taxon from Sanchahe Cave, in Guizhou, China.

ACKNOWLEDGEMENTS

Yi Wu and Guo Zheng helped to prepare photos of the manuscript. Sarah C. Crews kindly checked the English of the manuscript. Peter Jäger, Yanfeng Tong and Yucheng Lin provided valuable comments on an early version of the manuscript.
