Abstract. The dynamics of contemporary media culture initiate formulation of the problem for study of cultural meanings in transdisciplinary vector. The text of this article is implemented in two areas of philosophical reflection, aesthetic and methodological. The aim of this paper is to clarify the specifics of "the cultural meanings" in the context of philosophical and aesthetic discourse, and study the role of media space in the operation, translation and transformation of cultural meanings. The study focuses on the aesthetic media, which in turn affects the information that is circulating in the media channel space of culture. In the context of the study authors to incorporate the philosophical discourse humanities articles and works of scholars such as H. Rickert, W. Benmina, R. Barth, A. Paul, A. Handle, revealing the intermediary in the process of transformation of cultural meanings, screen and monitor. Therefore, it affects the culture-discourse spaces: the transformation of values, ideals and cultural meanings.

Keywords: cultural meanings, cultural value, media room, virtual reality, aesthetic and media culture.

1. Introduction. Media space, media culture, and other dimensions media communication in the study is the subject of a wide range of sciences. In the context of philosophical reflection, special attention is given aesthetic and axiological aspects of the establishment and functioning of media space as the ultimate determinant of cultural meanings today. Aesthetization of virtual reality takes place in strategic communication practices because, first of all, it eliminates the request in freedom embodiment of dreams, illusions of the subject on the choice of the infinite palette of beauty, creativity in designing their own reality. The process is how to use artistic means of expression and in-depth and structural transformations of space with the accumulation of both traditional and cultural meanings and find new meanings and values of the era.

2. Materials and methods

In today's dynamic world of media component problem in the functioning of society is the main, as we observed general trends in media culture in the information society. This situation is directly related to the influence of audiovisual communications and media space in general for social segment, resulting in the formation of a new social reality, which initiates a change of consciousness, the formation and transformation of cultural meanings. Value-semantic perspective, which is directly linked with the dominance of the media segment of society, is by far not enough investigated, since only begin to form a philosophical discourse in the research category of "cultural meaning".

This topic has long remained in the circle on sociology, but cultural meanings are inextricably linked with established values and tradition, particularly the aesthetic nature.

The aim of this paper is to clarify the specifics of «the cultural meanings" in the context of contemporary

philosophical and aesthetic discourse to highlight the features of modern communication media space orientation and its role in cultural meanings in the process of aesthetization.

In order to achieve this goal, one should first of all come across works of modern scholars, who have raised this issue and paid the particular importance of cultural meanings of aesthetic media space.

3. Theoretical framework

The study of this problem contributed by scientists from different fields of knowledge, including philosophy, aesthetics, cultural studies, sociology. Referring to this philosophical and aesthetic context must be called W. Benjamin, McLuhan, N. Luhmann, Bourdieu, R. Barth and neo representatives, namely H. Rickert. It should be proaktsentuvaty role in the development of approaches to the problem of modern local researchers O. Pavlova, N. Kostenko, A. Knobs.

We consider appropriate to perform their understanding and interpretation of the concept of "cultural meaning", values and meaningful ideas of man and society of a certain historical period and civilization's identity. Cultural meanings include diverse palette of religious beliefs, moral principles, but in a particular culture, he stands quite clear of the core values for carriers of this culture.

4. Discussion

Renowned researcher media communication McLuhan examines the phenomenon of expanding human capabilities by means of communication, and modern sociologist N. Luhmann, notes that "communication in the art system - is the only form of communication that transmits not only the forms of meaning, but together with the physical senses influence feeling"[12, p. 45]. In this context,

according to the researchers media philosophy is as follows: "In the history of media imply continuation (extension) of our perceptual capabilities and communication ability, but with the observation that this growth can not be associated with the body organs short-sensations such as touch, smell, hearing "[14, p. 12]. It should be noted that the increase in range extension rights that are provided by communication media is not widely accepted as remain out of the media formats listed above bodies senses.

Therefore, the strategy is interpreted as aestheticization and compensation in the media fullness complex feelings. Those are more invariant to be artistic culture media space; the range of its aesthetic (in the classical sense of the process) is as small as possible.

The phenomenon of aesthetic culture media is presented in the works of foreign and local researchers. In this context of the problem, in order to understand the formation of specific aesthetic space in media, the researcher O. Pavlov said: "The classical aesthetics had some instructions that have structured its subject area. These included: the autonomy of the aesthetic sphere (search for Renaissance art history), self-sufficiency artistic abilities (David Hume), the presence of a priori principle of expediency (Kant), free expression of personality in the beautiful headlines (Schiller), nominated beauty is not as absolute values, and a sense of aesthetic pleasure of life (novel-ism), the justification of aesthetic knowledge as a system within rational-targeted ideas (G. Hegel). A day of total representation of reality by means of media leads to the definition of postmodern culture as "cultural industry" (Adorno), "hyperrealist" (R. Barthes), "spectacle society" (G. Debord), "the era of emptiness" (J. Lipovetsky). The objective of the study is the argument value mutual aesthetic sphere and the media in a situation hypostasis which is aesthetically transformed form of the present "[30]. Thus is formed a new phenomenon, which lasts transcoding aesthetic meanings in the new space culture. A clear system of art and aesthetic theory of patterns reinterpreted for implementing cultural meanings in the format of virtual reality. Cultural meanings in this context should be interpreted and how the various theoretical concepts of classical and modern aesthetics and how of sense that as the core culture values accumulate values, ideas and symbols of culture as a way of being human.

Aesthetization of media space is available in its various formats. Therefore, the film and television displays information as artistic and documentary, newsreel character in a kind of counterpoint Information Network, which dramatizes, ironically, transforms into game and in planar screen narrative. Political events receiving the tragic sound experience through artistic format of presentation: music, staffing, music video installation and entertainment. The media resource aims to create a special aesthetic space in 3D format by using various stereo. Of particular note is the Internet communication with the computer screen, which also is aesthetic techniques: design of web pages, websites, social media, design and presentation of news and more. Aesthetic means building virtual reality can create the illusion of creative actualization of the individual. If art in

the classical sense and artistic expression outside the context of media conversion is an act of true reality, the world of media technology - replacing this act proposed model of self-identity, which, in our opinion, because of space onscreen culture directed and realized artistic imagination of the recipient.

The cultural meaning as the accumulation of experiences, values and principles, ideas and symbols of culture in pre-Information Age was embodied in various forms of consciousness. The strong and representative - it reflects the history of art. System of styles, genres and art forms organizes time and spatial continuum in which art imagery represents the dominant meanings of culture, extrapolated from the sphere of religion, morality, politics, science. This aesthetic design requires skills and willingness of the recipient and professional artist. However, the media space opening conventional boundaries author and recipient, on the one hand creates a new structure of the embodiment of cultural meanings through a kind of connotative text, the other carries a similar aesthetic design as self-constructing world outside the media cultural space. Therefore, the consumer learns media products of modern aesthetic principles through which cultural meanings imposed perceives and embodies them in your own living space. The goal becomes the tool and vice versa. Media space acts as one of the aims of aesthetic construction of reality. As aqua surf, media slides after returning to the cultural space coast and dehydrate without further waves it is doomed to drought. Therefore, the aesthetic range of media space generates new techniques that are increasingly affecting the representation of consumers and transform reality.

A special technique that we believe deserves special attention is the modern way of aesthetic media space in the form of both destruction and creation of cultural meanings that directly indicate a fast track fame and recognition for someone who does not agree to "waste" time on professional development and is ready several steps to overcome the distance between the unknown and honor their creativity and filling various TV channels and websites. This glory is both instantly proclaiming and promptly lost. However, the latter remains behind the scenes media space.

The Ukrainian media culture, in our opinion, are examples of this strategy, including TV project cycles such as "X-Factor", "Everybody Dance", "Ukraine's Got Talent", and so on. The purpose of these transfers is articulated as the search for talent nuggets. However, we believe that this is a manipulative strategy to transform cultural meanings. Unlike the traditional way in the profession in those public institutions that are established to obtain it, in the mind of the recipient created the idea of the possibility to reduce this path, avoid formal court and become a better and more popular by the end of the project.

The winners of these projects "tasting" fame transferring other projects or become despondent in their abilities and skills, because their credibility was spent in vain. It is necessary to clarify that we are far from condemning such projects. They are spectacular, rating and ultimately what sounds from television screens is music. However, we

emphasize the substitution of deep meanings that destroy the aesthetic hierarchy of artistic culture and create variety of meanings.

Analyzing the cultural text as space formation of cultural meanings should refer to the concept of text analytics R. Barth. In order to understand what space the text should introduce such concepts as "codes" proposed by Robert Barro. According to the concept of the researcher codes permeate the cultural text as strings, forming its meaning. The researcher rejects the interpretation of meaning in one sense, since in his opinion it reduces the space of the text and leads to a narrow interpretation of meanings. Text inherent multiplicity: "It means it is not just a few meanings, but that it carried multiplicity of meaning as such - the multiplicity indestructible, not just tolerated. In the text there is no peaceful coexistence of meanings - crosses into their moves through them, so it is not exposed to pluralistic interpretation, it there is an explosion and scattering of meaning" [1, Article 67]. Thus, the very multiplicity of meanings understood only through codes and forms the space of the text. Text is inextricably linked and deterministic time-history, culture, meaning, society-man. In general we can say that the production is inextricably text included in the "pozatekstovu reality" and "symbolic space" [16, Article 42].

In optics study Audiovisual Communication should refer to the scientist W. Benjamin and his work entitled "Works of art in the age of technical reproducibility" in which the researcher described the formation visualized culture. W. Benjamin not only captures the change in a person's world, but also explores how this happens. The researcher tries to answer the question of how the development of technology, ie the reproduction of images affect the human perception of the world, the formation or modification of certain culture-heritage identity as we believed cultural meanings. An interesting phenomenon arises the problem of the disappearance of uniqueness.

Any attempt to reproduce an image generating secondary image that alters the interaction between the actor and the reality that the person who is trying to play the objective reality and the environment. The author claimed that "nature, facing the camera - is not nature, facing the eye; difference lies primarily in the fact that the place space assimilated by the human mind, taking up space, mastered unconscious" [2. S. 71]. In other words, play the objective reality in all its diversity, or create a double lens using cameras and camcorders impossible because the resulting image will subjective, there is such a thing as a distortion of cultural discourse. The above phenomenon can be interpreted; it does not give a complete picture of the world and not its extension. It should be noted that fixing through an intermediary (the objective lens) some point of life, we do not have the whole picture since pulling out pieces of the whole, which is not conducive to creating a complete image, and leads to a distortion of meaning. Undoubtedly, both time and space art basically is the only piece of reality. But after armory art artist through the prism of his philosophical offsetting entry and accumulated cultural meanings in a fiction work.

It provides a potential deployment and perception in its entirety reflection of the world to the recipient. A technical tool, as a mediator of this process as a mediator of creation and perception is not simply slows and reduces the asset art - actually blocks the opportunity for further term existence of art. It should be noted that the views of W. Benjamin is categorical and not common to all members of aesthetic thought of the XX-XXI centuries.

Science displays and actively exploring contemporary art practice in which substantial role played by the mass media. Conceptualization of the problem reflects the theory, the reception of which is those that depict the creative potential of modernization. Therefore, transformation of artistic practice and its theoretical reflection take place.

Special attention is given problem functioning and formation as cultural meanings and values. The most important part is presented media communication, which is the main source of knowledge of the world and becoming a person. Problem of self-identification of rights as part of socialization is related to the audiovisual communication that forms the world view and consciousness of the individual, his value orientations and constructs social reality. Cultural meanings are able to perform the fundamental function, namely the function of integration of society, maintaining its value and stability [23].

In our opinion, the concept of "cultural meanings" and "values", and most importantly their existence in the phenomenal field are inseparable and interdependent. Cultural meanings are a phenomenon that involves value orientations of the individual and society as a whole. Values considered in the paradigm of cultural identity, which are formed by means of established cultural meanings "core culture" according to the terminology representative of this trend H. Rickert adopted cultural tradition. H. Rickert mentions that "value - a spiritual purpose, vital practical setting, expressing nerve lively culture, its semantic core that reflects the dynamics of culture" [21, p. 365].

That is, the values are the result of the functioning of culture and cultural meaning as integral and as a culture. Understanding the meaning of meaning requires knowledge of human relationships or certain human groups both in actual life situation in which they are present, and with the life experiences of previous generations or the project of human life and the future [23].

One should refer to the importance of the individual value orientation. Value orientation is defined as the ratio of sample to a set of material and spiritual values and ideals that are considered as objects of goals and the means to meet the needs of individuals or social groups. Formed in the social practices, values mediate the impact of the environment: they accumulated experience of people. Having established orientation characterizes maturity as human beings, but these orientations are direct lever of influence Audiovisual Communication, which, in turn, is an active participant in the formation of the individual as a whole, and is an inexhaustible source of information about the world and the cultural world of humanity. Therefore, as a result of human activity, its existence is the formation of certain values, which

is primarily due to the existing cultural meanings inherent in society. Therefore, the value orientation is found in human activity as a hierarchy of benefits that a person gives their material and spiritual values [5, p. 305].

Since the inception of the society in the first place laid horizons of cultural meanings that are established informal rules of functioning and development of society. Reflection in mythological consciousness ideas about the world and man's place in it, the meaning of life and the inevitability of death and the fate of the hero exploit people and other ethnic characteristics forms meaning and form concentrated on the core of culture and determine the formation of cultural meanings. They direct the lives of people, as traditions and values are basic concepts as the cultural meanings are formed a number of legal, moral and ethical standards, which, depending on the policy are binding or not enforced. But in everyday life of each national community of people, some informal rules is imperative, though not enshrined in law. Cultural meanings form the perception of people, the deviation from certain rules considered non-conformist behavior. Broadcast cultural meanings, values and traditions is through communication that has different forms and manifestations (audio, video, or even tactile communication). With the development of XX century science and technology and progressive trends in media communications, cultural meanings lose their identity, because it is easily transformed and taking on new forms with curvature or distortion of cultural discourse with the help screen (display other forms of communication). In recent years, especially in connection with the intensive development and computer science, and computer engineering, and their active penetration into society are increasingly faced with a highly informative approach to understanding the essence of culture and education. This trend understands the educational process and the process of transmission of knowledge in general as a channel of information from the teacher, a teacher or even automated complex, which in the modern era of information can replace live communication with the user of this information. Hence the rather stable theory which involves the term "information technology teaching", it is the transfer and translation of knowledge is responsible for the establishment and development of individual assimilation of established norms, traditions, customs inherent in a given community cultural meanings and knowledge of the world. So speaking of broadcasting cultural meanings should not forget the importance of education in this process and in-depth use of media technologies, which in most cases form the identity of the information age.

Methodological problems in research focus of value and aesthetic understanding of the functioning of cultural meanings media space is interdisciplinary. Since the principle of using strategies in modern integrated approach: ideas, methods and technologies for producing, storing, selective sampling and operational insight to consumers of different types of scientific information can be useful and be required. Any attempt of using information and computer tools to intensify, intensify, ultimately optimize multi-component process of learning, skills, methods of creative activity, not

to mention the formation of the whole gamut of human relations to the world and to each other, his outlook, outlook, mentality, culture, behavior, Booz certainly deserves detailed study. Media space forms a natural tendency and the need for effective communication. In the context of aesthetic and axiological approach should be noted that the specific media culture is one in which create impression on the following: the main thing is not lost - the emotional character of a full life of people who perceive the information being broadcast, which is based on the appeal (appeal) to the individually unique spiritual world each of them an absolute priority to the uniqueness of the individual. In our opinion, this is one of the most dangerous illusions and disappointments, which is the main simulacrum media culture. Therefore, to a large extent to the problem should be addressed in the value-semantic context.

Unfortunately, today's society is biased media. Cultural meanings and culture as such typologies and dissolved in the media that replicates and promotes the heritage of culture and history. On the one hand by means of audiovisual communication, anyone can read a specific work of art, listen to any musical composition, but often you can also find signs of vandalism and frivolous perception of what he saw or heard. If the ring tone on your mobile phone is a classic song eventually over time it begins to annoy and its sound is often inappropriate and perception of others is shallow and frivolous. Crumbling certain cultural meanings that were put into the product during its creation, the distortion of social reality by means of a computer screen, TV, video and camera lenses constructed new cultural meanings that are not always true. Growing concerns about the culture of the same "one reality" losing self-evident under the pressure of many images that claim to be real and increasingly becomes a "negotiable" if on its identification requires someone consent. Generally refers to the legitimization of social media ontology. Since "be - is to be shown on television," as noted by Bourdieu [3, p. 205], or to attend, to be present in the world wide web, which is true not only for popular people, but also of any events, occurrences, status and styles.

5. Conclusions

Thus, aesthetic media space leads to expansion within the virtual reality cultural meanings of modernity. The principles of media aesthetics, in many respects form polyphony of theoretical approaches and artistic practices aimed at university effect without feedback from the recipient, but imitate updating as the performance in the virtual space of culture. Cultural meanings lost expression through the beautiful, tragic, heroic, etc. and expressed through spectacular music video, fragmented, and thus affect the aesthetic presentation of the recipient. The reality of media space provides the aesthetic experience of the subject in those key parameters aesthetic in which this development has commercial appeal. Aesthetic reduced to a bright, pleasant consolation. Virtual reality is no longer a feature of the real and the imaginary, because, being a virtual reality affects both aesthetically and in value-semantic dimensions.

It should also be noted that the axiological characteristics of cultural meanings are signs of transformation. The value system of higher goals, ideals realized in a culture is destroyed. They offered to replace and axiological trend that can be called, the value of freedom and choice. However, it is this value system is eliminated, as in the forms of new cultural meanings, mechanism becomes manipulative media culture. We believe that the value of freedom, the right to choose the immensity of information - values is an illusion media space, which are actually determined manipulative strategies of mass communication.
