ABSTRACT

Diabetes mellitus is one of the common metabolic disorders acquiring around 2.8% of the world's population and is anticipated to cross 5.4% by the year 2025. India is slated to be the diabetic capital of the world, with 50.8 million diabetics. Since ancient time plants have been exemplary source of medicine. Ayurveda and other Indian literature mentioned the used of plants in treatment of various ailments. Recently, the World Health Organization (WHO) recommended the use of medicinal plants for the management of DM and further encouraged the expansion of the frontiers of scientific evaluation of the hypoglycemic properties of diverse plant species. A comprehensive review was conducted to pile up information about medicinal plants used for the treatment of diabetes mellitus. The profiles presented include information about the scientific and family name, plant parts and test model used, the degree of hypoglycemic activity, and the active chemical constituents. The review describes some new bioactive drugs and isolated compounds from plants such as diallyl trisulfide, lophenol, cinnamaldehyde, curcumin, mangiferin, oleanolic acid, coagulanolide, tetrahydrocurcumin showing significant insulinomimetic and anti-diabetic activity with more efficacy than conventional hypoglycaemic agents. Thus, from the review majorly, the antidiabetic activity of medicinal plants is attributed to the presence of polyphenols, flavonoids, terpenoids, coumarins and other constituents which show reduction in blood glucose levels. The review also discusses the management aspect of diabetes mellitus using these plants and their active principles.

INTRODUCTION

Diabetes mellitus is a chronic metabolic disorder caused by an absolute or relative lack of insulin and/or reduced insulin activity that results in hyperglycemia and abnormalities in carbohydrate, protein and fat metabolism¹. Due to insulin deficiency, people are suffering from diabetes have high levels of blood glucose. Non-insulin-dependent diabetes mellitus or Type 2 diabetes, is the most common form of the disease, that accounts for 90%–95% of cases in which the body is not able to produce enough insulin or properly use it². According to International Diabetes Federation (IDF), the world diabetic population in 2015 was estimated to be 415 million and the prevalence increased from 4.7% in 1980 to 8.5% in 2015. The International Diabetes Federation (IDF) revealed that, in 2040, diabetes will affect 642 million persons making it one of the leading cause of death and disability worldwide³. Now a days, oral blood glucose lowering agents and insulin are used in the clinical management of diabetes mellitus⁴. The current therapies that are available for diabetes include insulin and various other oral antidi-

abetic agents such as sulfonylureas, biguanides and glinides. Many of them have serious side effects; therefore, the search for more safer and effective hypoglycemic agents is one of the important areas for investigation². Unfortunately, the prevalence of this disease continues to rise worldwide and little can be done to prevent the delay of its secondary complications⁴. Plants are good source of drugs and many of the currently available drugs have been derived directly or indirectly from plants². Human race has used plants for the treatment of diabetes mellitus, there are 700 recipes containing more than 400 plants known for their antidiabetic activity. India is sitting on a gold mine of well-recorded and well-practiced knowledge of traditional herbal medicine and hence must capitalize on this herbal wealth by promoting its use worldwide⁴. Natural products having antidiabetic potential that acts through either insulinomimetic or secretagogues properties are reviewed in this paper. List of the medicinal plants having antidiabetic potential according to plant part used and mode of action were presented in table 1.

CONCLUSION

Many medicines in use today have their origin in plants. Herbal medicines are increasingly becoming popular and hence, it is prudent to search for options from medicinal plant extracts for new antidiabetic hypoglycemic substances. The present review gives comprehensive details of antidiabetic plants used in the treatment of diabetes mellitus. The presences of bioactive chemicals are mainly responsible for this antidiabetic action. Some of these plant derived medicines, however, offer potential for cost effective management of diabetes through dietary interventions, nutrient supplementation and combination therapies with synthetic drugs in the short term and as the sole medication from natural sources over the long term. Consequently, many efforts should be afforded to optimize a procedure for antidiabetic screening of different plants extracts as well as isolated bioactive compounds for the discovery of new natural herbal antidiabetic drugs. That can be used as an alternative to synthetic oral hypoglycemic drugs with less or even no prominent side effects.
