### ABSTRACT

Computational biology avails us to prognosticate the functionality in the uncharacterized proteins sequence utilizing the various strategies of comparative proteomics *Neisseria meningitidis* (Z2491) isolated into different serogroups on the substructure of the immunochemistry of their capsular polysaccharides; Serogroup A strains are in charge of pandemics of meningococcal illness, and in this manner dresiness and mortality connected with this infection . Our endeavour is to prognosticate the structure and function of uncharacterized proteins present in the genome of *Neisseria meningitidis* by the application of computational methods and Bioinformatics web tool. The probable function prognostication of the uncharacterized protein was done by utilizing Bioinformatics web implements like CDD-BLAST, INTERPROSCAN, PFAM and COGs by probing sequence databases for the presence of orthologous enzymatic conserved domains in the hypothetical sequences. While 3D structures were constructed utilizing PS2 Server (Protein Structure Prediction server). In this study investigate presences of enzymatic conserved domain in selected 200 uncharacterized proteins; s their function was unknown. These deciphered enzymatic information of uncharacterized proteins c might be used for the advance study of structural, functional, and evolutionary history of *N. meningitidis* and its life cycle.

**Keywords:** *Neisseria meningitidis* (Z2491) Bioinformatics web tools, Hypothetical protein Conserved, Domains Structure prediction.

### INTRODUCTION

*Neisseria meningitidis* (Z2491) is intracellular human-categorical pathogens which are responsible for septicaemia and meningitis after crossing of the blood brain barrier,*Neisseria meningitidis* (Z2491) is a major causal agent of morbidity and mortality throughout the globe. (Shobana, 2011). It has been responsible for epidemics throughout the Asia and Africa (Genco, 2010) Computational biology avails us to prognosticate the functionality in the uncharacterized sequences using

various procedure of comparative proteomics (Gore, 2009). The program's capability of homology testing by utilizing defined databases and culling standard parameters, the presence of the enzymatic conserved domain/s in the sequences could be probed out and it may avail in the categorizing protein into categorical enzymatic family. Conserved domain databases like CDD-BLAST, INTERPROSCAN, PFAM and COGs can search the orthologous sequence in database for the query sequence, while assisting in the categorization of the target sequence in particular families. (Gore D G 2010) This study will avail us to understand the probable functions of uncharacterized proteins in *Neisseria meningitidis* (Z2491). Several online machine driven servers are available which can construct 3D structures for selected sequences by utilizing the strategy of aligning target sequences with orthologous sequences by virtue of sequence homology and predicated on that, constructs the 3D structure for target protein utilizing best scored template of orthologous family member. Here, we have presaged 3-D structure utilizing Protein Structure Prediction Server (PS2 server).

## MATERIALS AND METHODS

### **Data collection:**

The complete protein coding sequences of first two hundred uncharacterized proteins of *Neisseria meningitidis* (Z2491) were selected and downloaded from the website [www.genome.jp/kegg/](http://www.genome.jp/kegg/).

### **Functional Annotations:**

uncharacterized proteins were screened for the presence of enzymatic conserved domains utilizing sequence homogeneous attribute search with close orthologous family members available in sundry protein databases utilizing the web-implements. Four bioinformatics web tools like: CDD-BLAST ([www.ncbi.nlm.nih.gov/BLAST](http://www.ncbi.nlm.nih.gov/BLAST)) Altschul (1997) INTERPROSCAN ([www.abi.ac.uk/interpro](http://www.abi.ac.uk/interpro)) Zdob (2001), Pfam ([www.pfam.sanger.ac.uk](http://www.pfam.sanger.ac.uk)) Bateman (2000), COGs ([www.ncbi.nih.gov/cog](http://www.ncbi.nih.gov/cog)) Roman (2000) were utilized, which shows the ability to probe the defined conserved domains in the sequences and avail in the relegation of proteins in opportune family.

### **Functional categorization:**

Screening of uncharacterized proteins by four web implements shown variable results for the presence of

enzymatic conserved domains in target sequences, resultant functional hypothetical sequences can be categorized into different confidence levels on the substructure of collective results of web implements utilizing following parameters:-

- 1) If the given four implements show the same functions then the confidence level were to be 100 percent.
- 2) If the given three implements show the same functions then the confidence level were to be 75 percent.
- 3) If the given two implements show the same functions and remaining two shows different function then the confidence level were to be 50 percent.
- 4) If the given four implements show the all different functions then the confidence level were to be 25 percent.

### **Protein structure prediction:**

Several online automated protein structure prediction servers are available. Out of that, online PS2 (Protein Structure Prediction) Server was used. ([www.ps2.life.nctu.edu.tw/](http://www.ps2.life.nctu.edu.tw/)) Chen (2006) this server accept input the protein (query) sequences in standard FASTA format and utilizes the both strategies of alignment by combining the filtering power of the programs PSI-BLAST, IMPALA and T-COFFEE in both target - template selection and alignment and new target proteins 3D structures were constructed utilizing structural situating information of atomic coordinates for kenned template in PDB format utilizing best scored alignment data. Template selection was prognosticated on the constant conserved domain in the functional annotations that should be accessible in the structure alignment for modeling purport.

## RESULTS AND DISCUSSION

Bioinformatics web implements results used to annotated 131 hypothetical proteins out of 200 protein sequences into particular Enzymatic family predicated on query sequence shown homology with kenned enzyme sequence and categorized with variable confidence levels which are represented in Table 1 and derived Functional Percentage Classification of whole proteins are represented in Table 2.

### **Protein structure prediction:**

The (PS)2 Server constructs the three dimensional structure of uncharacterized proteins in PDB format. Where in 200 uncharacterized protein sequences of *Neisseria meningitidis* (Z2491) analyzed, (PS)2

satisfactorily prognosticated structures of '89' uncharacterized proteins utilizing best scored orthologous template. The templates which scored best with hypothetical sequences are represented by their features such as KEGG number, template, identity, score

and E-value as in Table 3. Where out of 200 sequences (PS)2 fail to construct protein structures of 111 protein sequences because absence of copacetic template for structure building.

The analysis of the uncharacterized proteins is proved only on expression of the selective gene through cloning. The results obtained are concluded on the

bases of available information in different databases and we can presage the structure and function of any organisms by utilizing web implements.

## CONCLUSION

This study sorted 131 functional proteins out of 200 uncharacterized proteins of *Neisseria meningitidis* (Z2491) by applying the parameters of confidence level and pair-wise sequence alignment along with structure prognostication implements, In out of 200, only 89 3-D structures for uncharacterized proteins were constructed utilizing (PS)2 servers as expeditious automated homology modelling web server. This prognosticated 3-D structures may avail in establishing their role in life cycle of *Neisseria meningitidis* (Z2491) whose exact role in phage-host lifecycle is still obscure and can be utilized in future for the study of virulence and evolution of both phage-host systems.
