

# LAUGHING GAS- AN ANALGESIC IN DENTISTRY

## Introduction

On 10th december 1844, Horace Wells, a dentist of Hartford, Connecticut attended a 'lecture exhibition' by an itinerant scientist Gardner Quincy Colton<sup>1</sup> and recognized the anaesthetic property of (N<sub>2</sub>O) Nitrous oxide<sup>2</sup>. The following day, Wells requested Colton to extract one of his teeth by administering N<sub>2</sub>O on him by an inhaler in front of another dentist William Riggs, a witness<sup>3</sup>. But Wells' success and overconfidence led him to failure. In January 1845 while he was demonstrating an amputation publicly in Harvard Medical School Boston, under N<sub>2</sub>O analgesia, the patient cried out in pain because his technique probably was not correct. The pioneer Dentist Wells, who was the first one to recognize the anaesthetic qualities of N<sub>2</sub>O, became insane out of frustration. He was arrested for throwing acid at two women in Newyork city and committed suicide in 1848<sup>4</sup>

**Key words :** Nitrous oxide, analgesic, entonox, agranulocytosis

## Preparation

N<sub>2</sub>O was first prepared by Joseph Priestly in 1773 by heating Ammonium nitrate with iron. The gas evolved was passed through water to eliminate toxic oxides of nitrogen<sup>5</sup>. In 1790s, Humphrey Davy, a British Chemist noted its exhilarating effect and nitrous oxide gained its nick name-'laughing gas'. In 1800 he published "As nitrous oxide... appears capable of destroying pain, it may probably be used with advantage during surgical operations." In 1868 Edmund Andrews, a Chicago surgeon, made it popular in dental surgery using it with oxygen.<sup>6</sup>

## Physical property

Non-flammable, though helps in combustion even in the absence of O<sub>2</sub> (Neuman et al, 1993). It is of low molecular weight, sweet smelling and of poor blood solubility (0.46). Inhalation of the gas increases the incidence of nausea and vomiting (Divatia et al., 1996 Fisher, 1996; Hartung, 1996)

Diffusion hypoxia-occurs when inhaled N<sub>2</sub>O is withdrawn abruptly. High volume of N<sub>2</sub>O from the blood stream comes to alveoli (Fink, 1955) and dilutes the (lung) pulmonary O<sub>2</sub> (PaO<sub>2</sub>) and also CO<sub>2</sub> (PaCO<sub>2</sub>) which is a stimulus for respiration (Sheffer et al., 1972). The outpouring of N<sub>2</sub>O thus causes fall of O<sub>2</sub> saturation of

blood. This results in hypoxia which is called as diffusion hypoxia. So after discontinuing N<sub>2</sub>O, inhalation the lung must be filled up with O<sub>2</sub> alone at least for five minutes<sup>7</sup>

Availability in royal blue coloured cylinder as pure N<sub>2</sub>O or in body blue and shoulder white coloured cylinder as a mixture of N<sub>2</sub>O & O<sub>2</sub> in 50:50 composition (Entonox). A full cylinder of N<sub>2</sub>O at room temperature contains liquid N<sub>2</sub>O not vapour. So the cylinder should be kept upright when in use. The pressure gauge thus is not an indicator about the quantity of the gas remaining in the cylinder. Entonox but remains in gaseous form unless temperature drops below -70°C. In such a condition a thorough mixing of the gas is necessary before using the cylinder<sup>8</sup>.

Latent heat of vaporization required for the conversion of liquid gas to gaseous form, is proportional to the amount of substances vaporized. So when from a cylinder of liquified gas, the flow of N<sub>2</sub>O is more, latent heat of vaporization increases and the temperature of the cylinder decreases. As a result the saturated vapour pressure in the cylinder falls in an increasing rate and no gas can be obtained from the cylinder. The flow of gas can be obtained again by turning off the cylinder for a minute. The pressure inside the cylinder then builds up, the magnitude of latent heat of vaporization falls and conversion of liquid occurs. It was a regular feature in dental anaesthesia when high flow of N<sub>2</sub>O from small portable cylinder were used.

## Clinical use

Good analgesic. The analgesic effect is observed after 2-3 minutes of inhalation of 50% N<sub>2</sub>O. The effect is titrable. It can be used as a sole analgesic agent for procedures involving gums<sup>9</sup> But when used for anaesthetic purpose a second agent needs to be added.

Entonox is used for alleviating pain in minor procedures in dentistry.

## Adverse effect

6 litre/min for six hours continuous inhalation gives pain relief equivalent to 50mg of Pethidine/30mg of Pentazocine (Fortwine) but results in megaloblastic anaemia and agranulocytosis. Chronic exposure to high concentration may cause a condition resembling subacute

combined degeneration of the spinal cord<sup>10</sup>

**Precaution**

- (a) Respiratory tract disease when the gas is used as a sole analgesic agent. Because it diffuses into closed air space causing significant expansion of lung bullae
- (b) First trimester of pregnancy ,the gas may be teratogenic,(c) bloked nose,(d) full stomach may induce vomiting.

ENTONOX CYLINDER BODY BLUE SHOULDER WHITE

NITROUS OXIDE CYLINDERS DANGLING FROM AN ANAESTHETIC MACHINE ROYAL BLUE BODY AND SHOULDER

# MACRO Hi-Tech Dental Lab. Products

AN ISO 9001:2008 CERTIFIED COMPANY

Manufacturers & Exporter & Importers of : DENTAL EQUIPMENT & MACHINERY

India's First Largest Selling Products

**India's First**  
**The Zirinku Mill™** (MACRO DENT) zirconia milling system produces zirconia oxide crown & bridge frameworks easily and affordable for any size laboratory. This system makes the services of external CAD/CAM laboratory unnecessary. It is very impressive with simplicity of its user guidance and enables to carry out finest details as well as dimensional flexibility during the milling process. Using the well-established pantographic principle, optimally functional single copings, bridges (up to 16 units) The 5 axis are the success factor for an excellent fit. **The Zirinku Mill TM copy milling technique takes only about 20 to 25 minutes per unit.**  
**This Zirinku Mill copy milling system** includes: the milling unit, sintering furnace, suction, curing light, infrared lamp, including zirconia blocks and 2 years warranty.

**India's First**  
 Macrodent Perfect Flexi, Acrylic & Polymer Injection system (3 in 1 System) for all kinds of Flexible RPD's & Full Dentures, Pressable Acrylic Dentures & Pressable Crown & Bridges (Metal Free). Macrodent Perfect Flexi & Acrylic & Polymer Injection System means value. It gives quality aesthetics at an affordable Price, easy to handle, easy to maintain, 3 years warranty

Macrolite Dasoro Ceramic Polymer curing system designed for curing indirect composit restorations. Macrolite Dasoro allows the light Polymerizing of all Acrylic & Light sensitive(Resins) Materials in the Market.

Application : Full & Partial veneerings of crown & bridges. Telescopic crown, Implant supported Restorations, multilayered Jacket crown, inlays & onlays.

Macro Dent Vacuum Mixer for Bubble free Mixing of investment material & die stones.

**MACRODENT SANDBLASTER:**  
 Two aluminum tanks to be used for aluminum oxide from 50 microns to 250 microns or glass beads, two air pressure controllers, big glass view, it can be attached with vacuum. Pneumatic foot control, two tungsten carbide tips for micro-sandblasting, air gun.

Macrodent Macro Flexi Dental Resin (Cartridges) for Flexible Dentures. It is nylon based acrylic & monomer free resin. It has good flexibility, unbreakable, most economical..

Address : Backside T.V. Centre, Near Gurudwara Assa Puran, Dyal Nagar, Jalandhar-02 (Pb.)
