THE PHILOSOPHICAL ESSENCE AND FUNCTIONS OF GEOECONOMIC THINKING

Abstract: In this article the author considers the problem of formation of geo-economic thinking in the context of globalization and identifies its essence, functions and features in terms of social philosophy.

Key words: geo-Economics, geo-economic thinking, globalisation, geo-economic process, the owner.

Language: English

Introduction

Geoeconomics explores the transformation of international economic relations, world economic integration and the creation of competitive regional economic conditions under the influence of globalization factors. Geoeconomics is a policy of redistributing resources and world income. The main super incomes (the rent of boundary energy) are received by world poles of economic and technological development. Geo-economic thinking reflects the state's ability to develop geopolitical strategies based on the power of capital.

Geo-economic processes occurring in the global economy require each owner to quickly interpret the logic of their developments and create their own trade relations. The concept of the logic of the development of geo-economic processes is carried out through the geo-economic way of thinking.

At the same time, if the social entity consists of a complex of processes and events aimed at satisfying the needs of people, as well as those created from their practical activities, social consciousness is a reflection of natural and social reality, a complex of sensitivities, attitudes, attitudes, ideas, theories relating to a specific period of society. Since social consciousness can be

divided into several forms, based on their reflection on the events and processes of the social entity, such as: economic, political, moral, legal, aesthetic, ecological, etc.

Materials and Methods

Taking the characteristics given by the philosophy to the concept of social consciousness as a methodological basis, the following definition can be given to the concept of geoeconomic consciousness. Geo-economic consciousness, being one of the forms of social consciousness, is a unified system of theories and thoughts, attitudes, ideals, ideas, sensations, passions aimed at sensation, mental awareness and change in the future economic and spiritual life of the existing society, in particular, economic relations, arising between people.

This definition also shows that geo-economic consciousness incorporates such aspects as emotional knowledge and mental thinking. It highlights the place of economic thinking.

The Russian scientist L.N. Ponomarev, from Uzbek scientists B.Valiyev, gives the following definition to the concept of economic thinking: "From the point of view of philosophy, economic thinking is

the main form of displaying economic events, expedient and generalized knowledge of important connections in economic relations, creating new ideas awareness of trends in economic events and processes. It is a process of displaying economic relations and events in such forms of thought as an idea, concepts, judgment, conclusion. This is the promotion and development of thoughts associated with the formation of certain economic ideas, knowledge, ideas, views on economic reality ". Based on this thought and on the basis of which aspects of economic processes it relates to, economic thinking can be divided into macroeconomic thinking, microeconomic thinking, national economic thinking, geoeconomic thinking, geo-financial thinking, ethno-economic thinking, external economic thinking, etc.

Geoeconomic thinking is one of the forms of economic thinking, dialectic reflection of such forms of thought as concept, judgment, conclusion in the form of ideas, ideals, attitudes, thoughts, actions occurring in the geoeconomic space of economic, political, legal and spiritual processes of all subjects entering into economic relations in the global market. In particular, it is a modern system of mental activity, which embodies the theoretical and practical knowledge, experience and skills acquired for profit on the basis of knowledge of the trends in the process of commodity circulation. The role of the conscious beginning, the level of development of the culture of thinking in geo-economic reality tends to increase. Geoeconomic thinking, which is a complex phenomenon, is the object of study for a number of sciences, including philosophy, economic theory, sociology, psychology, and is increasingly being studied by these sciences. Each of them considers geoeconomic thinking within its own subject.

The process of formation of geoeconomic thinking incorporates the following two features:

The first feature is related to the task of shaping geo-economic thinking in human consciousness and contains the following two directions, on the one hand, at the empirical level by sensation in connection with the direct vision, testing of current economic relations between states, as well as economic processes occurring in the world on the other hand, it includes works on the formation at the level of theoretical and practical knowledge by studying textbooks, articles, scientific collections and other literature in which swarm reflected the economic knowledge accumulated by society.

The second feature is connected with the ways and means of organizing the formation in the minds of people of geoeconomic thinking, on the one hand includes the formation of geoeconomic thinking among owners, which is a direct subject of geoeconomics, on the other hand, the organization of work to improve geoeconomic thinking among the population of the country. These two features

complement each other and constitute two relative sides of a whole.

The main driving force of geo-economics is the owners. The country's position in the geo-economic world is determined by what place it occupies in the global market, how it is included in the system of world exchanges. At the same time, the exchange of goods and the movement of capital are only part of the flows flowing in the geo-economic space. In addition to goods and finance, cultural values (ideas, technologies, cultural patterns, etc.) are moving around the world, and there is a turnover of human capital and the natural environment. In particular, the country's place in the geo-economic space is related to how widely the geo-economic thinking of the owners is formed. That is why the problem of the formation of geo-economic thinking among owners is included in a number of urgent tasks of strategic importance to our state.

According to the material and spiritual tendencies of dialectic thinking, the geo-economic thinking of owners has ontological and epistemological foundations.

The ontological foundations of the geo-economic thinking of owners are:

firstly, the presence of tangible and spiritual property, the possession of this property by the owner, as well as the use of the benefits of this property by the company according to the established norms;

secondly, the quantity and quality of property accumulated in the hands of the owner;

thirdly, the share of profits derived from economic relations between owners, both inside and outside the state;

fourth, indicators of the quality and quantity of the constructed facilities and technologies imported and introduced into production at the expense of this profit;

Fifthly, it is the real existence of world commodity markets and the significance of the material nature of the turnover of goods occurring in such markets.

The epistemological basis of the geo-economic thinking of owners is:

1) the economic thinking of the owner and his levels;

2) the scientific potential of the owner;

3) initiative and skillfulness, owner's enterprise;

4) the ability of the owner to know the existing economic space;

5) the spiritual world of the owner, etc.

Conclusion

As can be seen from the above, the geo-economic thinking of owners consists of the mutual unity of the objective side - ontological and subjective - epistemological.

Impact Factor:

ISRA (India) = 3.117	SIS (USA) = 0.912	ICV (Poland) = 6.630
ISI (Dubai, UAE) = 0.829	PIHHI (Russia) = 0.156	PIF (India) = 1.940
GIF (Australia) = 0.564	ESJI (KZ) = 8.716	IBI (India) = 4.260
JIF = 1.500	SJIF (Morocco) = 5.667	OAJI (USA) = 0.350

The main directions of formation of geo-economic thinking of the class of owners of the following:

1. Implementation of work on the formation of a complete picture in the minds of the owners of the geo-economic picture of today's world.

The geo-economic picture of today includes the following: first, a general description of the world economic spaces that have arisen as a result of the mutual influence of the spaces of the national and transnational economies; secondly, the interpretation in convenient forms of the global economic space in order to make decisions that are useful from the point of view of the strategy of states in international economic relations; thirdly, the division of global economic spaces into separate spheres and levels; fourth, includes spaces for receiving a share of world income.

It turns out that all the above-mentioned features constitute the empirical basis of geoeconomic thinking, and on its basis logical consciousness,

judgment and conclusion of the economic thinking itself.

2. Formation of geo-economic thinking through the formation of scientific knowledge and understanding of the geo-economic space and time.

It follows from the above that the geo-economic space is the location of geo-economic attributes in a certain place, such as the mass of goods, barter, market, profit and income, and the geo-economic time is the frequency of successive relationships in a certain time interval of geo-economic attributes. So, geoeconomics exists only in a certain time and space as a socio-economic event.

Only in the event that the owners will have accurate knowledge of the geo-economic picture of the modern world that exists in the geo-economic space and time, will they be able to receive profits and revenues from the sales of their goods on the world market. And this can be achieved only by seeing the bright ray of geo-economic thinking.
