#### Abstract

2-Pyridinecarboxamide was synthesized from 2-picoline through two-steps reaction. Initially, 2-picoline was converted into 2-cyanopyridine by ammoxidation in a stainless-steel fixed-bed reactor at $370^{\circ} \mathrm{C}$ with $\mathrm{V}_{2} \mathrm{O}_{5}$ loaded on $\mathrm{TiO}_{2}$ as catalyst. The 2-cyanopyridine was transformed into 2-pyridinecarboxamide through oxidation hydrolysis in basic solution using $\mathrm{MnO}_{2}$ as oxidant at $70{ }^{\circ} \mathrm{C}$. The final product was characterized by FT-IR, NMR and UV-visible analysis, and 2-pyridinecarboxamide in the final product was determined using HPLC. The crystal structure of 2-pyridinecarboxamide was investigated using X-ray diffraction and SHELX 2018/3 (sh) software and the result indicated that 2-pyridinecarboxamide crystallized in the monoclinic system, space group P21/n with $\mathrm{a}=5.207(2), \mathrm{b}=7.097(3)$, $\mathrm{c}=$ 16.243(6) $\AA, V=595.7$ (4) $\AA^{3} ; Z=4$.

Keywords: 2-Picoline, 2-Pyridinecarboxamide, Crystal structure.

## INTRODUCTION

The importance of pyridinecarboxamide as pharmaceutical and agricultural intermediates has been well established. For example, 2-pyridinecarboxamide could be used for synthesis of antipsychotic drugs [1], glucokinase activators [2] and as ligand in the formation of $\mathrm{La}(\mathrm{III})$ and $\mathrm{Ce}(\mathrm{III})$ complexes [3]. 3-Pyridinecarboxamide is the key intermediate for preparing imidazo[4,5-c]pyridinecarboxamide derivatives that could be utilized as PARP-1 inhibitors [4]. There are several methods could be utilized for preparing pyridinecarboxamide, such as aminification reaction of pyridinecarboxylic acid or its derivatives with ammonia [5], controlled hydrolysis of cyanopyridine [6] and conversion of pyridinecarboxaldehyde with hydroxylamine [7], etc. Herein, we report the synthesis of 2-pyridinecarboxamide from 2-picoline through two-steps, which includes ammoxidation and oxidation hydrolysis. The crystal structure of 2-pyridinecarboxamide also was investigated.

## EXPERIMENTAL

2-Picoline, vanadium pentoxide $\left(\mathrm{V}_{2} \mathrm{O}_{5}\right)$, titanium dioxide $\left(\mathrm{TiO}_{2}\right)$ and manganese dioxide $\left(\mathrm{MnO}_{2}\right)$ were purchased from Sinopharm Chemical Reagent Co. Ltd. (Shanghai, P.R. China).

All chemicals were of reagent grade and used without further purification as received.

Fourier transform infrared (FT-IR) spectrum was recorded with KBr pellets on a Nicolet Nexux FT-IR 670 spectrometer, sixteen scans at a resolution of $4 \mathrm{~cm}^{-1}$ were averaged and referenced against air. ${ }^{1} \mathrm{H}$ NMR spectrum was obtained with Bruker AV-500 spectrometer at 500.13 MHz and measured in $\mathrm{D}_{2} \mathrm{O}$ solution at $30 \pm 0.5^{\circ} \mathrm{C}$ and the sample was dissolved in a 5 mm diameter tube at a concentration of about $20 \mathrm{mg} \mathrm{mL}^{-1}$. UVvisible spectrum was obtained with TU-1810 ultraviolet-visible spectrophotometer with scan interval was $400 \sim 190 \mathrm{~nm}$ and water as solvent. The contents of final product was determinated by L600 high performance liquid (HPLC) chromatography and X-ray diffraction was performed on a Bruker APEXII CCD diffractometer.

Preparation of catalyst: The catalyst of $\mathrm{V}_{2} \mathrm{O}_{5}$ loaded on $\mathrm{TiO}_{2}$ was prepared according to reported method [8] with some modification. Briefly, 150 g of $\mathrm{TiO}_{2}$ and 20 g of $\mathrm{NH}_{4} \mathrm{VO}_{3}$ were added to 50 mL deionized water. The mixture was formed into a cylindrical catalyst of $5 \sim 7 \mathrm{~mm}$ length and $2 \sim 4 \mathrm{~mm}$ diameter. The cylindrical catalyst was dried for 1.0 h at $60^{\circ} \mathrm{C}$, then calcined for 2.0 h at $250^{\circ} \mathrm{C}$ and for 5.0 h at $750^{\circ} \mathrm{C}$ in muffle furnace. The content of $\mathrm{V}_{2} \mathrm{O}_{5}$ loading in catalyst was $8.3 \mathrm{~mol} \%$.

[^0]Preparation of 2-cyanopyridine: Ammoxidation for synthesizing 2-cyanopyridine was carried out in a stainlesssteel fixed-bed reactor filled with the catalyst of $\mathrm{V}_{2} \mathrm{O}_{5}$ loaded on $\mathrm{TiO}_{2}$, and the height of catalyst bed was 40 cm . The reactor was surrounded by a heating jacket to control the temperature of fixed bed at $370^{\circ} \mathrm{C}$. The reactants were fed from the top of reactor and three calibrated flow meters were used for ammonia, air, and the mixture of 2-picoline and water, respectively. The product of ammoxidation was cooled using a condenser and 2-cyanopyridine was obtained by vaccum distillation. When the molar ratio of 2-picoline versus ammonia was 1.0:6.0 and that of 2-picoline versus water was 1.0:3.3, yield of 2-cyanopyridine was found to be $86.40 \%$.

Synthesis of 2-pyridinecarboxamide: 2-Cyanopyridine $(5.20 \mathrm{~g}, 0.050 \mathrm{~mol}), 32 \mathrm{~mL}$ of acetone, 32 mL of $5 \%$ aqueous solution of NaOH and 4.35 g of $\mathrm{MnO}_{2}(0.050 \mathrm{~mol})$ were added into reaction bottle and reacted for 3.5 h at $70^{\circ} \mathrm{C}$ with continuous stirring. The reactant was distilled under $60^{\circ} \mathrm{C}$ for removing the acetone and then filtrated to separate the remaining $\mathrm{MnO}_{2}$ and its conversion product. The filtrate was cooled to ambient temperature for forming the crystal of 2-pyridinecarboxamide before filtration. The wet filter residue was dried at $60^{\circ} \mathrm{C}$ using vacuum drying oven and 5.14 g of 2-pyridinecarboxamide was obtained (Scheme-I).

X-ray crystallography: A colourless block-like crystal of 2-pyridinecarboxamide grown in acetone- $\mathrm{H}_{2} \mathrm{O}\left(\mathrm{V}_{\text {acetone }}: \mathrm{V}_{\mathrm{H} 2 \mathrm{O}}\right.$ $=1.0: 1.0)$ with dimensions of $0.18 \mathrm{~mm} \times 0.16 \mathrm{~mm} \times 0.11 \mathrm{~mm}$ was used for structural determination. Diffraction data were collected on a Bruker APEXII CCD diffractometer by using graphite mono chromated $\mathrm{MoK} \alpha$ radiation $(\lambda=0.71073 \AA$ ). The structure was solved by direct methods with SHELXL-97 and refined on $\mathrm{F}^{2}$ by extinction method with SHELXL-2018/3 (sh). All the non-hydrogen atoms were refined anisotropically.

## RESULTS AND DISCUSSION

FT-IR analysis: In the FT-IR spectrum of synthesized compound, the absorption bands at $3418.34 \mathrm{~cm}^{-1}$ was assigned to $v(\mathrm{~N}-\mathrm{H})$ of free amide, 3276.05 and $3177.21 \mathrm{~cm}^{-1}$ were assigned to $v(\mathrm{~N}-\mathrm{H})$ of associated amide. The peaks at $1662.77,1602$ and $1389.83 \mathrm{~cm}^{-1}$ were ascribed to $v(\mathrm{C}=\mathrm{O}), \delta(\mathrm{N}-\mathrm{H})$ and $v(\mathrm{C}-\mathrm{N})$ of primary amide, respectively. Similarly, a band at $756.57 \mathrm{~cm}^{-1}$ was ascribed to $\gamma(\mathrm{C}-\mathrm{H})$ of monosubstituted pyridine ring and $630.41 \mathrm{~cm}^{-1}$ was ascribed to $\gamma(\mathrm{N}-\mathrm{H})$ of primary amide (Fig. 1).

NMR analysis: In ${ }^{1} \mathrm{H}$ NMR of the synthesized compound, the peaks at 8.47 and 7.50 ppm were ascribed to the proton of C 4 and C5 of pyridine ring, respectively. Similarly, a peak at $7.87 \sim 7.88 \mathrm{ppm}$ were ascribed to the proton of C3 and C6 of pyridine ring, whiel the peak at 4.70 ppm was ascribed to the H of primary amide and residual proton of $\mathrm{D}_{2} \mathrm{O}$ (Fig. 2).

UV-visible analysis: In the UV-visible spectrum of 2-pyridinecarboxamide, the presence of absorbing peaks at 217 and 265 nm indicated the existence of conjugate structure in its molecule (Fig. 3).

Fig. 1. FT-IR spectrum of final product

Fig. 2. ${ }^{1} \mathrm{H}$ NMR spectrum of final product

Fig. 3. UV-visible spectrum of final product
HPLC analysis: It could be seen from the HPLC spectrum that the main component in the final product was much high, and the result of area normalization indicated that the content of 2-pyridinecarboxamide in the final product was $99.87 \%$ (Fig. 4). Thus, from the analysis of the characterization data, the synthesized product is confirmed as 2-pyridinecarboxamide.

Scheme-I: Route for preparing 2-pyridinecarboxamide

Fig. 4. HPLC spectrum of final product
Crystal structure: The crystal configuration of 2-pyridinecarboxamide was confirmed by X-ray structural analysis. The X-ray data collection is presented in Table-1 and the geometric parameters for 2-pyridinecarboxamide are listed in Table-2. The molecular structure and packing plot of 2-pyridinecarboxamide are shown in Figs. 5 and Fig. 6, respectively.

Fig. 6. Packing plot of 2-pyridinecarboxamide
According to X-ray crystallographic data, 2-pyridinecarboxamide crystallized in a $\mathrm{P} 21 / \mathrm{n}$ space group of the monoclinic system. The strong intramolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ contacts were observed and hydrogen-bond geometry for 2-pyridinecarboxamide are listed in Table-3. And the unit cell parameters having space group $\mathrm{P} 21 / \mathrm{n}$ with $\mathrm{a}=5.207(2), \mathrm{b}=7.097(3), \mathrm{c}=$ 16.243(6) $\AA, V=595.7$ (4) $\AA^{3} ; Z=4$ were found.
