

# On Essential (Complement) Submodules with Respect to an Arbitrary Submodule 

E. A. Al-Dhaheri*, B. H. Al-Bahrani<br>Department of Mathematics, College of Science, University of Baghdad, Baghdad, Iraq

#### Abstract

In this paper we Proved other properties of essential and complement submodules to an arbitrary submodule of an R-module M.We prove that for a family $\left\{\mathrm{M}_{\alpha}\right\}_{\alpha \in_{\Lambda}}$ of modules. If $\mathrm{T}_{\alpha}$ and $\mathrm{N}_{\alpha}$ are submodules of $\mathrm{M}_{\alpha}$ with $\mathrm{N}_{\alpha}+\mathrm{T}_{\alpha} \leq_{\mathrm{T} \alpha-\mathrm{e}} \mathrm{M}_{\alpha}, \forall \alpha$, then $\oplus_{\alpha \in_{\Lambda}}\left(\mathrm{N}_{\alpha}+\mathrm{T}_{\alpha}\right) \leq_{\oplus}{ }_{\alpha \in_{\Lambda} \mathrm{T}_{\alpha-\mathrm{e}}} \oplus_{\alpha \in_{\Lambda}} \mathrm{M}_{\alpha}$. Also we show that for submodules T, A, B and C of a module M such that $\mathrm{T} \leq \mathrm{A} \leq \mathrm{C}$. If B is $\mathrm{T}-\mathrm{c}$ for A in M and C is $\mathrm{T}-\mathrm{c}$ for B in M , then C is maximal T - essential extension of A in M .

Keywords: Essential submodules, T-essential submodules.

## 1. Introduction

In this paper, all rings are. Associative with. identity and all modules are unitary left R-modules. Recall that a submodule A of an R-module $M$ is essential submodule of $M\left\{\right.$ denoted by $A \leq_{e} M$ \},,if for every $\mathrm{B} \leq \mathrm{M}, \mathrm{A} \cap \mathrm{B}=0$ implies that $\mathrm{B}=0$.
A submodule $B$ of a module $M$ is called complement for a submodule $A$ of $M$ if it is maximal. with respect to. the property that $\mathrm{A} \cap \mathrm{B}=0$. More details about essential submodules and complement can be found in [1-4].In [5], the authors introduced the definition of $\mathrm{T}-$ essential (complement) submodules as follows:
Let $\mathrm{T} \lesseqgtr \mathrm{M}$, a submodule A of M is called T - essential submodule of $\mathrm{M}\{$ denoted by $\mathrm{A} \leq \mathrm{T}$ - M \}, provided that $\mathrm{A} \nsubseteq \mathrm{T}$ and for each submodule B of $\mathrm{M}, \mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$ implies that $\mathrm{B} \leq \mathrm{T}$. A submodule B of M is called a T -.complement for a submodule A in M if B is maximal with respect to the property that $\mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$.
In section 2,we develop the properties of T - essential submodules and we introduce the definition T essential monomorphism. We show that, $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$ iff $\forall \mathrm{Rx} \leq \mathrm{M}, \mathrm{Rx} \not \leq \mathrm{T}$ implies that $\mathrm{A} \cap \mathrm{Rx} \neq \mathrm{T}$, see Proposition 2.5.Also we prove that, if every T -essential submodule A of M with $\mathrm{T} \leq \mathrm{A}$ is finitely

[^0]generated, then $\frac{M}{T}$ is Noetherian, seeTheorem2-15.In section3, we develop the properties of Tcomplement submodules. We prove that. For submodules A, B and C of a module M. If $\mathrm{A} \leq_{\mathrm{e}} \mathrm{M}$ and C is a complement for B in M , then $\mathrm{A}+\mathrm{C} \leq_{\mathrm{C}-\mathrm{e}} \mathrm{M}$, see proposition 3.9 .

## 2.The $\mathbf{T}$ - essential submodules

In ,this section, we proved basic properties of the essential submodules with respect to an arbitrary submodule T of an R-module Mand we introduced the definition ofT- essential monomorphism.
Definition2.1.[5]Let $T$ be a proper. submodule of a module $M$. A submodule $A$ of a module $M$ is called .T-essential submodule, denoted by $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$, provided that $\mathrm{A} \$ \mathrm{~T}$ and for each submodule B of a module $\mathrm{M}, \mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$ implies that $\mathrm{B} \leq \mathrm{T}$. Clearly that when $\mathrm{T}=0$, then $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}}$ Miff $\mathrm{A} \leq_{\mathrm{e}} \mathrm{M}$.
The following .proposition gives the basic properties of $\mathrm{T}-$ essential submodules, see [5].

## Proposition 2.2 [5]

Let T, A and B be submodules. of a module M. Then
1- If $\mathrm{A} \leq_{T-e} \mathrm{M}$, then $\frac{(\mathrm{A}+\mathrm{T})}{\mathrm{T}} \leq_{e} \frac{\mathrm{M}}{\mathrm{T}}$.
2- If $\mathrm{T} \leq \mathrm{A}$, then $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$ iff $\frac{\mathrm{A}}{\mathrm{T}} \leq_{e} \frac{\mathrm{M}}{\mathrm{T}}$.
3- $\quad \mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$ iff $\forall \mathrm{x} \in \mathrm{M}-\mathrm{T}, \exists \mathrm{r} \in \mathrm{R}$ such that $\mathrm{r} \mathrm{x} \in \mathrm{A}-\mathrm{T}$.
4- If $A$ and $B$ are $T$ - essential submodules of $M$, then $A \cap B \leq \leq_{T-e} M$.
5- Let $\mathrm{A} \leq \mathrm{B} \leq \mathrm{M}$ such that $\mathrm{T} \leq \mathrm{B}$. Then $\mathrm{A} \leq_{T-\mathrm{e}} \mathrm{M}$ iff $\mathrm{A} \leq_{T-\mathrm{e}} \mathrm{B}$ and $\mathrm{B} \leq_{T-\mathrm{e}} \mathrm{M} .6$ - Let $\mathrm{h}: \mathrm{M}_{1} \rightarrow \mathrm{M}_{2}$ be epimorphism. If $A \leq_{T-e} M_{2}$, then $f^{-1}(A) \leq_{f}^{-1}{ }_{(T)-\mathrm{e}} \mathrm{M}_{1}$, where $\mathrm{M}_{1}$ and $\mathrm{M}_{2}$ are left R-modules .
Remark2.3. Let T and Abe submodules of a module M .
1- Let $\mathrm{T}=\mathrm{M}$. Then $\mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$ and $\mathrm{B} \leq \mathrm{T}, \forall \mathrm{B} \leq \mathrm{M}$.
2- Let $\mathrm{T} \leqq \mathrm{M}$. Then $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$ iff $\forall \mathrm{B} \leq \mathrm{M}, \mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$ implies $\mathrm{B} \leq \mathrm{T}$.
Proof:1-clear.
2-clear.For the converse, we only need to show that $A \not \leq T$. Assume $A \leq T$ and let $B=M$. Then $\mathrm{A} \cap \mathrm{B}=\mathrm{A} \leq \mathrm{T}$, but $\mathrm{B}=\mathrm{M} \nsubseteq \mathrm{T}$, which is a contradiction, thus $\mathrm{A} \nsubseteq \mathrm{T}$.
Hence we see that the condition $T$ is a proper submodule of $M$ is not necessary. Thus, in this paper by a T - essential submodule we mean let T be a submodule of M (not necessary proper) and let A be a submodule of M . A is T - essential submodule of M if $\forall \mathrm{B} \leq \mathrm{M}, \mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$ implies that $\mathrm{B} \leq \mathrm{T}$.
Cleary that when $T=M$, then every submodule of $M$ is $T-$ essential in $M$.

## Propositio2.4

Let $T$ and $A$ be submodules of a module $M$. Then $A \leq_{T-e} M$ iff for every submodule $B$ of $M, B \nsubseteq T$ implies that $\mathrm{A} \cap \mathrm{B} \nsubseteq \mathrm{T}$.
Proof: The proof is clear and hence is omitted .

## Proposition 2.5

Let T and Abe submodules of a module M . Then $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$ iff $\forall \mathrm{Rx} \leq \mathrm{M}, \mathrm{Rx} \nsubseteq \mathrm{T}$ implies that $\mathrm{A} \cap \mathrm{Rx} \not \leq \mathrm{T}$.
Proof: clear by proposition 2.4.For the converse, let $\mathrm{B} \leq \mathrm{M}$ such that $\mathrm{B} \nsubseteq \mathrm{T}$. We want to show that $A \cap B \notin T$. Let $x \in B-T$,then $R x \not \leq T$, By our assumption $A \cap R x \nsubseteq T$ and hence $A \cap B \nsubseteq T$.Thus $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$.

## Proposition 2.6

Let $T, A, A_{1}, B$ and $B_{1}$ be submodules. of a module $M$ such that $A \leq x_{T-\mathrm{e}} A_{1}$, and $B \leq{ }_{T-\mathrm{e}} \mathrm{B}_{1}$, then $\mathrm{A} \cap \mathrm{B} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{A}_{1} \cap \mathrm{~B}_{1}$.
Proof: Let $A \leq_{T-e} A_{1}$ and $B \leq_{T-\mathrm{e}} B_{1}$. To show that $A \cap B \leq_{T-\mathrm{e}} A_{1} \cap B_{1}$ letx $\in\left(A_{1} \cap B_{1}\right)-T$. Since $A \leq_{T-e} A_{1}$, then $\exists r \in R$ such that $r x \in A-T$.
But $r x \in B_{1}-T$ andB $\leq_{T-\mathrm{e}} B_{1}$, then $\exists r_{1} \in R$ such that $r_{1}(r x) \in B-T$.
Hence $r_{1} r x \in(A \cap B)-T$. Thus $A \cap B \leq_{T-\mathrm{e}} A_{1} \cap B_{1}$.

## Proposition 2.7

Let $T, A$ be ideals of a ring $R$. If $T$ is a prime ideal of $R$ and $A \nsubseteq T$ then $A \leq \leq_{T-e} R$.
Proof: Let $x \in R-T$ and $y \in A-T$. Clearly that $x . y \in A$. Claim that $y . x \notin T$. To show that assume $y$. $\mathrm{x} \in \mathrm{T}$. But T is a prim ideal, then either $\mathrm{y} \in \mathrm{T}$ or $\mathrm{x} \in \mathrm{T}$ which is a contradiction. Thus $\mathrm{y} . \mathrm{x} \in \mathrm{A}-\mathrm{T}$ and $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{R}$.
Before we give next proposition, we will recall the following definition.

Let M be 'an R - module. Recall that $\mathrm{Z}(\mathrm{M})=\{\mathrm{x} \in \mathrm{M}$; ann ( x$\left.) \leq_{\mathrm{e}} \mathrm{R}\right\}$ is called ; the singular submodule of $M$. If $Z(M)=M$ then $M$ is called singular module. If $Z(M)=0$, then $M$ is called a nonsingular module, [6] .

## Proposition 2.8

Let $T$ and $A$ be submodules of a module $M$. If $A+T \leq_{T-e} M$, then $\frac{M}{A+T}$ is singular .
Proof: Since $A+T \leq_{T-e} M$, then by proposition $2.2-2, \frac{A+T}{T} \leq_{e} \frac{M}{T} \cdot B y[6, p .32] \frac{(M / T)}{((A+T) / T)}$ is singular . By third isomorphic theorem $\frac{M / T}{(A+T) / T} \cong \frac{M}{A+T}$. Then $\frac{M}{A+T}$ is singular .
We1 introduce, the following ,,definition
Definition 2.9. Let $M_{1}$ and $M_{2}$ be two modules and let $T$ be a submodule of a module $M_{2}$. A homomorphism $h: \mathrm{M}_{1} \rightarrow \mathrm{M}_{2}$ is called $\mathrm{T}-$. essential monomorphism if $\mathrm{h}\left(\mathrm{M}_{1}\right) \leq_{\mathrm{T}_{-\mathrm{e}}} \mathrm{M}_{2}$.

## Proposition2.10

For submodules $T$ and $A$ of $a$ module $M$. The, following statement are equivalent. $1-\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$.
2-The inclusion map $I_{A}: A \rightarrow M$ is a $T$-essential monomorphism;
3-for each module $M_{1}$ and $f \in \operatorname{Homomorphism}\left(M, M_{1}\right)$ such that $\operatorname{Ker}(f) \cap A \leq T$, then $\operatorname{Ker}(f) \leq T$.
Proof: $1 \rightarrow 2$ )Let $B \leq M$ such that $I_{A}(A) \cap B \leq T$. To show $B \leq T$, since $I_{A}(A) \cap B=A \cap B \leq T$, and since $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$. Then $\mathrm{B} \leq \mathrm{T}$.
$2 \rightarrow 1)$ It's clear.
$1 \rightarrow 3$ ) Let $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$ and $\mathrm{f}: \mathrm{M} \rightarrow \mathrm{M}_{1}$ be a homomorphism such that $\operatorname{Ker}(\mathrm{f}) \cap \mathrm{A} \leq \mathrm{T}$. To show $\operatorname{Ker}(\mathrm{f}) \leq \mathrm{T}$, since $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$. Then $\operatorname{Ker}(\mathrm{f}) \leq \mathrm{T}$.
$3 \rightarrow 1$ ) To show $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{M}$, let $\mathrm{B} \leq \mathrm{M}$ such that $\mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$, To show $\mathrm{B} \leq \mathrm{T}$.
Define $\Pi: M \rightarrow \frac{\mathrm{M}}{\mathrm{B}}$ be a natural epimorphism,$\Pi \in \operatorname{Homomorphism}\left(\mathrm{M}, \frac{\mathrm{m}}{\mathrm{B}}\right.$ ). ThenKer $\Pi \cap \mathrm{A}=$ $A \cap B \leq T$, hence $\operatorname{Ker} \Pi=B \leq T$.
Remark 2.11.The sum of T - essential submodules need not be T - essential. As shown in the following example
Example 2.12 Let $\mathrm{R}=\mathrm{Z}, \mathrm{M}=\mathrm{Z} \oplus \mathrm{Z}_{2}$ and let $\mathrm{T}=\{0\}, \mathrm{A}_{1}=\mathrm{A}_{2}=2 \mathrm{Z} \oplus(\overline{0}) \leq \mathrm{M}, \mathrm{B}_{1}=\mathrm{Z} \oplus(\overline{0})$ andB ${ }_{2}=Z(1, \overline{1}) \leq M$. One can easily show that $A_{1} \leq_{\{0\}-\mathrm{e}} \mathrm{B}_{1}$ and $\mathrm{A}_{2} \leq_{\{0\}-\mathrm{e}} \mathrm{B}_{2}$. ButA $\mathrm{A}_{1}+\mathrm{A}_{2}=\mathrm{A}_{1}=2 \mathrm{Z} \oplus(\overline{0})$ andB $B_{1}+B_{2}=Z \bigoplus(\overline{0})+Z(1, \overline{1})=M$, and $(2 Z \oplus(\overline{0})) \cap\left(0 \oplus Z_{2}\right)=0$. So $A_{1}+A_{2}$ is not $T$ - essential in $M$.
Theorem 2.13.Let $\left\{M_{\alpha}, \alpha \in \Lambda\right.$ \}be a family of modules and $T_{\alpha}$ and $N_{\alpha}$ be submodules of a module $\mathrm{M}_{\alpha}, \forall \alpha \in \Lambda$.If $\mathrm{N}_{\alpha}+\mathrm{T}_{\alpha} \leq_{\mathrm{T} \alpha}$-е $\mathrm{M}_{\alpha} \forall \alpha \in \Lambda$.Then $\bigoplus_{\alpha \in \Lambda}\left(\mathrm{N}_{\alpha}+\mathrm{T}_{\alpha}\right) \leq_{\oplus}{ }_{\alpha \in \Lambda} \mathrm{T}_{\alpha}{ }_{-\mathrm{e}} \bigoplus_{\alpha \in \Lambda} \mathrm{M}_{\alpha}$. Proof:-Assume that $\mathrm{N}_{\alpha}+\mathrm{T}_{\alpha} \leq_{\mathrm{T} \alpha-\mathrm{e}} \mathrm{M}_{\alpha} \forall \alpha \in \Lambda$. Then by proposition $2.2-2 \frac{\mathrm{~N} \alpha+\mathrm{T} \alpha}{\mathrm{T} \alpha} \leq \mathrm{e} \frac{\mathrm{M} \alpha}{\mathrm{T} \alpha}, \forall \alpha \in \Lambda$. By [2, corollary 5.1.7, p. 110] $\bigoplus_{\alpha \in \Lambda}\left(\frac{\mathrm{N} \alpha+\mathrm{T} \alpha}{\mathrm{T} \alpha}\right) \leq_{e} \bigoplus_{\alpha \in \Lambda}\left(\frac{\mathrm{M} \alpha}{\mathrm{T} \alpha}\right)$. Hence $\frac{\oplus \alpha \in \Lambda(\mathrm{N} \alpha+\mathrm{T} \alpha)}{\oplus \alpha_{\in \Lambda} \mathrm{T} \alpha}=\frac{[(\oplus \boldsymbol{\alpha} \in \Lambda \mathrm{N} \boldsymbol{\alpha})+(\oplus \boldsymbol{\alpha} \in \Lambda \mathrm{T} \boldsymbol{\alpha})]}{\oplus \boldsymbol{\alpha} \in \Lambda \mathrm{T} \boldsymbol{\alpha}}$ $\leq_{e} \frac{\oplus \alpha \in \Lambda \mathrm{M} \alpha}{\oplus \alpha \in \Lambda \mathrm{T} \alpha}$. Therefore , by proposition $2.2-2, \bigoplus_{\alpha \in \Lambda}\left(\mathrm{N}_{\alpha}+\mathrm{T}_{\alpha}\right) \leq_{\oplus}{ }_{\alpha \in \Lambda} \mathrm{T} \alpha-\mathrm{e} \bigoplus_{\alpha \in \Lambda} \mathrm{M}_{\alpha}$.
Corollary 2.14. Let $\left\{M_{\alpha}, \alpha \in \Lambda\right\}$ be a family of modules and $T_{\alpha}, N_{\alpha}$ be submodules of $M_{\alpha}$ with $T_{\alpha} \leq N_{\alpha}$, $\forall \alpha \in \Lambda$. If $N_{\alpha} \leq_{T \alpha-\mathrm{e}} \mathbf{M}_{\alpha} \forall \alpha \in \Lambda$, then $\bigoplus_{\alpha \in \Lambda} \mathrm{N}_{\boldsymbol{\alpha}} \leq \oplus_{\alpha \in \Lambda} \mathrm{T}_{\alpha-\mathrm{e}} \bigoplus_{\alpha \in \Lambda} \mathrm{M}_{\alpha}$.
Theorem 2.15. Let $T$ be a submodule of a module $M$. If every $T$-essential submodule $A$ of $M$ with $T \leq A$ is finitely generated, then $\frac{M}{T}$ is Noetherian.
Proof:- Let $\frac{A}{T} \leq \frac{M}{T}$, to show $\frac{A}{T}$ is finite generated. By Zorn's lemma $\frac{A}{T}$ hasa complement say, $\frac{B}{T}$ in $\frac{M}{T}$.By[6,proposition.1.3,p.17]then $\frac{A}{T} \oplus \frac{B}{T} \leq \frac{M}{T}$, and then $\frac{A+B}{T} \leq \frac{M}{T}$. ByProposition2.2- 2,then $A+B \leq_{T-e} M$. Then $A+B$ is finite generated, and then $\frac{A}{T} \oplus \frac{B}{T}$ is finite generated. Let $\frac{A}{T} \oplus \frac{B}{T}=$ $\mathrm{R}\left(\mathrm{a}_{1}+\mathrm{b}_{1}+\mathrm{T}\right)+\cdots+\mathrm{R}\left(\mathrm{a}_{\mathrm{n}}+\mathrm{b}_{\mathrm{n}}+\mathrm{T}\right), \mathrm{a}_{\mathrm{i}} \in \mathrm{A}, \mathrm{b}_{\mathrm{i}} \in \mathrm{B} \forall \mathrm{i}=1,2, \cdots, n$.
Claim that $\frac{A}{T}=R\left(a_{1}+T\right)+\cdots+R\left(a_{n}+T\right)$. Let $x+T \in \frac{A}{T}$. Then $x+T=r_{1}\left(a_{1}+b_{1}+T\right)+\cdots+r_{n}\left(a_{n}+b_{n}+T\right)$, $a$ ${ }_{i} \in A, b_{i} \in B \forall i=1,2, \cdots, n$. Therefore $\left[x-\left(r_{1} a_{1}+\cdots+r_{n} a_{n}\right)\right]+T=\left(r_{1} b_{1}+\cdots+r_{n} b_{n}\right)+T \in\left(\frac{A}{T}\right) \cap\left(\frac{B}{T}\right)=T$. Then $\left[x-\left(r_{1} a_{1}+\cdots+r_{n} a_{n}\right)\right]+T=T$, therefore $x-\left(r_{1} a_{1}+\cdots+r_{n} a_{n}\right) \in T$. Hence $x+T=\left(r_{1} a_{1}+\cdots+r_{n} a_{n}\right)+T$, hence $x+T \in R\left(a_{1}+T\right)+\cdots+R\left(a_{n}+T\right)$, thus $\frac{A}{T}$ is finite generated.

## 3. The T-complement submodules

In, this section, we proved properties of the complement submodule with respect to an arbitrary submodule T of an R -module M
Definition3.1[5] Let $T$ be a proper, submodules 'of a module $M$ and let Abe a submodule of M.A submodule $B$ of $M$ is called a $T$-.complement to $A$ in $M\{$ denoted by $B$ is a $T-c$ to $A$ in $M$, if $B$ is maximal with, respect to the property that $\mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$.
Let $M$ be a module and let $T=0$. For a submodules $A$ and $B$ of $M$. Clearly that $B$ is a $T-c$ to $A$ in $M$ iff $B$ is a complement for $A$ in $M$.
Theorem 3.2. Let $T$ and Abe submodules of, a module $M$, then $A$ has a $T$-.complement in $M$.
Proof: Let $T$ and $A \leq M$. We want to show $A$ has a $T$-complement. Let $F=\{B \leq M \mid A \cap B \leq T\}$. $F \neq \varnothing$, since $0 \in F$, let $\{\mathrm{C}\}_{\alpha \in \Lambda}$ be a chain in F . To show that $\left(\mathrm{U}_{\alpha \in \Lambda} \mathrm{C}_{\alpha}\right) \in \mathrm{F}$. Clearly $\mathrm{U}_{\alpha \in \Lambda} \mathrm{C}_{\alpha} \leq$ M. Since $\mathrm{A} \cap\left(\mathrm{U}_{\alpha \in \Lambda} \mathrm{C}_{\alpha}\right)=\mathrm{U}_{\alpha \in \Lambda}\left(\mathrm{A} \cap \mathrm{C}_{\alpha}\right) \leq \mathrm{T}$. Then $\mathrm{U}_{\alpha \in \Lambda} \mathrm{C}_{\alpha} \in \mathrm{F}$. . By Zorn's lemma F has a. maximal element say $H$. Claim $H$ is a $T-c$ to $A$ in $M$. To show that, let $H \lesseqgtr L \leq M$ such that $A \cap L \leq T$, therefore $\mathrm{L} \in \mathrm{F}$ which is contradiction. Thus $\mathrm{H}=\mathrm{L}$.
Remark 3.3Let $T$ and $A$ be submodules of a module $M$. Then a $T$-complement of $A$ in $M$ need not be unique as the following example shows : Consider $\mathrm{Z}_{12}$ as Z -module . Let $\mathrm{A}=\{\overline{0}, \overline{3}, \overline{6}, \overline{9}\}$ and $\mathrm{T}=\{\overline{0}, \overline{2}, \overline{4}, \overline{6}, \overline{8}, \overline{10}\}$. Let $\mathrm{B}=\{\overline{0}, \overline{6}\}$ and $\mathrm{C}=\{\overline{0}, \overline{4}, \overline{8}\}$, one can easily show that each of $\mathrm{B}, \mathrm{C}$ is a $\mathrm{T}-$ complement to A in $\mathrm{Z}_{12}$.

## Proposition3.4.

Let $T, A$ and $B$ be submodules of a module $M, i f \frac{B}{T}$ is a complement for $\frac{A}{T}$ in $\frac{M}{T}$, then $B$ is $a, T-c$ to $A$ .in $M$. The converse is true if $T \leq A \cap B$.
Proof: Let $\frac{B}{T}$ is a complement for $\frac{A}{T} i n \frac{M}{T}$, then $\frac{B}{T}$ is maximal with, respect to the , property $\left(\frac{A}{T}\right) \cap\left(\frac{B}{T}\right)=0$. Hence $B$ is. maximal with respect to the property $A \cap B=T$. To show that $B$ is a $T-c$ to $A$ in $M$, let $\mathrm{B} \leq \mathrm{N} \leq \mathrm{M}$ such that $\mathrm{A} \cap \mathrm{N} \leq \mathrm{T}$. Now $\mathrm{A} \cap \mathrm{N} \leq \mathrm{T}=\mathrm{A} \cap \mathrm{B}$. But $\mathrm{B} \leq \mathrm{N}$, therefore $\mathrm{A} \cap \mathrm{B} \leq \mathrm{A} \cap \mathrm{N}$.
Thus $A \cap B=A \cap N$. Therefore $\left(\frac{A}{T}\right) \cap\left(\frac{B}{T}\right)=\frac{(A \cap B)}{T}=\frac{(A \cap N)}{T}=\frac{T}{T}=0 . B u t \frac{B}{T}$ is a complement for $\frac{A}{T}$ in $\frac{M}{T}$, so $\frac{N}{T}=\frac{B}{T}$ and hence $N=B$. Thus $B$ is a $T-c$ to $A$ in $M$.For the converse, let $B$ is a $T-c$ to $A$ in $M$ and $T \leq A \cap B$.
Then $T=A \cap B \cdot\left(\frac{A}{T}\right) \cap\left(\frac{B}{T}\right)=\frac{(A \cap B)}{T}=\frac{T}{T}=0$. Now let $\frac{B}{T} \leq \frac{N}{T} \leq \frac{M}{T}$ such that $\left(\frac{A}{T}\right) \cap\left(\frac{N}{T}\right)=0$. Then $\frac{(A \cap N)}{T}=0$, and hence $A \cap N=T$. But $B$ is a $T-c$ to $A$ in $M$, therefore $N=B$. Thus $\frac{N}{T}=\frac{B}{T}$.
Corollary 3.5. Let $T, A$ and $B$ be submodules of a module $M$ such that $\frac{M}{T}=\left(\frac{A}{T}\right) \oplus\left(\frac{B}{T}\right)$. Then B is a T - c to A in M.
Proof:-Let $\frac{M}{T}=\left(\frac{A}{T}\right) \oplus\left(\frac{B}{T}\right)$.Then $\left(\frac{A}{T}\right) \cap\left(\frac{B}{T}\right)=0$. Claim that $\frac{B}{T}$ is a complement for $\frac{A}{T}$ in $\frac{M}{T}$. $\operatorname{Let} \frac{B}{T} \leq \frac{N}{T} \leq \frac{M}{T}$ such that $\left(\frac{A}{T}\right) \cap\left(\frac{N}{T}\right)=0 . \operatorname{Since} \frac{M}{T}=\left(\frac{A}{T}\right)+\left(\frac{B}{T}\right)$ and $\frac{B}{T} \leq \frac{N}{T}$. Then $\frac{M}{T}=\frac{A}{T}+\frac{N}{T} . \operatorname{So} \frac{B}{T}=\frac{N}{T}$ and hence $\frac{B}{T}$ is a complement for $\frac{A}{T}$ in $\frac{M}{T}$. By Proposition 3.4, Bis a $T-c$ to $A$ in $M$.

## Proposition3.6.

Let $T, A, B$ and $C$ be submodules of an module $M$ with $A \leq C$. If $B$ is an $T-c$ to $A$ in $M$ and $C$ is a $T-$ c to B in M . Then B is a $\mathrm{T}-\mathrm{c}$ to C in M .
Proof: Let $B$ is a $T-c$ to $A$ in $M$ and $C$ is a $T-c$ to $B i n M$ and $A \leq C$. Then $B \cap C \leq T$. To show that $B$ is a $T-c$ to $C$ in $M$, let $B \leq L \leq M$ such that $L \cap C \leq T$. Since ( $A \leq C$ ), then $A \cap L \leq C \cap L \leq T$, implies that $\mathrm{A} \cap \mathrm{L} \leq \mathrm{T}$. But B is maximal with respect to property $\mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$, therefore $\mathrm{B}=\mathrm{L}$. Thus B is a $\mathrm{T}-\mathrm{c}$ to C in M.

## Proposition3.7

Let $\mathrm{T}, \mathrm{A}, \mathrm{B}$ and C be submodules of a module M such that $\mathrm{T} \leq \mathrm{A} \leq \mathrm{C}$. If B is a $\mathrm{T}-\mathrm{c}$ to A in M and C is a $\mathrm{T}-\mathrm{c}$ to B in M . Then C is a maximal T -essential extension of A in M .
Proof:-Let B is a $\mathrm{T}-\mathrm{c}$ to A in $\mathrm{M}, \mathrm{C}$ is a $\mathrm{T}-\mathrm{c}$ to B in M and $\mathrm{T} \leq \mathrm{A} \leq \mathrm{C}$. First, we prove that $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{C}$, let $K \leq C$ such that $A \cap K \leq T$.Claim that $A \cap(B+K) \leq T$. To show that, let $a=b+k$ such that $a \in A$, $b \in B, k \in K$. Thus $b=a-k \in B \cap C \leq T \leq A$. Hence $a-b=k \in A \cap K \leq T$ and hence $a \in T$. But $B$ is maximal with respect .to the property $\mathrm{A} \cap \mathrm{B} \leq \mathrm{T}$, therefore $\mathrm{B}+\mathrm{K}=\mathrm{B}$. Then $\mathrm{K} \leq \mathrm{B}$. Hence $\mathrm{K}=\mathrm{K} \cap \mathrm{C} \leq \mathrm{B} \cap \mathrm{C} \leq \mathrm{T}$. Thus $\mathrm{A} \leq_{\mathrm{T}-\mathrm{e}} \mathrm{C}$. Now to show C is maximal T -essential extension of A in M . Let $\mathrm{C} \leq \mathrm{N} \leq \mathrm{M}$ with
$A \leq T$. $N$. Since $A \cap B \leq T$, then $(A \cap B) \cap N \leq T \cap N=T$, and hence $A \cap(B \cap N) \leq T$. Since $A \leq T-e n$, then $\mathrm{B} \cap \mathrm{N} \leq \mathrm{T}$. But C is maximal with respect to the property $\mathrm{B} \cap \mathrm{C} \leq \mathrm{T}$, therefore $\mathrm{N}=\mathrm{C}$.

## Proposition3.8

Let $A$ and $B$ be submodules of a module $M$ then $B$ is a complement for $A$ in $M$ iff $A \oplus B \leq B-e M$. Proof:
$\rightarrow)$ Let $\mathrm{A} \leq \mathrm{M}$ and B is an complement for A in M .Then by [6,prop.1.3,p.17] $\mathrm{A} \oplus \mathrm{B} \leq_{e} \mathrm{M}$. But B is closed in $M$, by[6, prop.1.4,p.18] therefore $\frac{(A \oplus B)}{B} \leq_{e} \frac{M}{B}$,by[6,prop.1.4,p.18]. By proposition $2.2-2$, $\mathrm{A} \oplus \mathrm{B} \leq_{\mathrm{B}} \mathrm{e} \mathrm{M}$.
$\leftarrow)$ Let $\mathrm{A} \oplus \mathrm{B} \leq_{\mathrm{B}-\mathrm{e}} \mathrm{M}$, then $\mathrm{A} \cap \mathrm{B}=0$. By proposition $2.2-2, \frac{(\mathrm{~A} \oplus \mathrm{~B})}{\mathrm{B}} \leq_{e} \frac{\mathrm{M}}{\mathrm{B}}$. Now, let $\mathrm{B} \leq$ Hand $\mathrm{A} \cap \mathrm{H}$ $=0$. Now, $\frac{H}{B} \leq \frac{M}{B}$ and $\frac{(A \oplus B)}{B} \cap \frac{H}{B}=\frac{(A \oplus B) \cap H}{B}=\frac{(A \cap H) \oplus B}{B}$ by modular law $\frac{0 \oplus B}{B}=0$. But $\frac{(A \oplus B)}{B} \leq \frac{M}{B}$, therefore $\frac{H}{B}=0$. Hence $\quad B=H$. Thus $B$ is a complement for $A$ in $M$.

## Proposition3.9

Let A, B and C be submodules of a module M . If $\mathrm{A} \leq_{e} \mathrm{M}$ and C is a complement for B in M , then $A+C \leq_{C-e} M$.
Proof: Let $A \leq_{e} M$ and $C$ is a complement for B in M. Claim that $\frac{(A+C)}{C} \leq_{e} \frac{M}{C}$. First we prove that, let $\frac{\mathrm{N}}{\mathrm{C}} \leq \frac{\mathrm{M}}{\mathrm{C}}$ such that $\frac{(\mathrm{A}+\mathrm{C})}{\mathrm{C}} \cap \frac{\mathrm{N}}{\mathrm{C}}=0 . \operatorname{Then} \frac{(\mathrm{A}+\mathrm{C}) \cap \mathrm{N}}{\mathrm{C}}=0$. By modular $\operatorname{law} \frac{(\mathrm{A} \cap \mathrm{N})+\mathrm{C}}{\mathrm{C}}=0$. Implies that $(A \cap N)+C=C$.Therefore $A \cap N \leq C$.
Hence $(A \cap N) \cap B \leq C \cap B=0$, then $A \cap(N \cap B)=0$. Since $A \leq_{e} M$, then $N \cap B=0$. But $C$ is maximal with respect to, the property $B \cap C=0$, so $N=C$. Thus $\frac{(A+C)}{C} \leq_{e} \frac{M}{C}$. By proposition 2.2-2, $\mathrm{A}+\mathrm{C} \leq_{\mathrm{C}-\mathrm{e}} \mathrm{M}$.

## Proposition3.10

Let $T, A, B$ and $C$ be submodules of a module $M$ such that $T \leq A$. If $A \leq(T+C)-e=M$ and $C$ is a $T-c$ to B in $M$, then $\frac{(A+C)}{C} \leq_{(T+C)-e} \frac{M}{C}$.
Proof : Let $A \leq_{(T+C)-e} M$ and $C$ is a $T-c$ to $B$ in $M$. To show $\frac{(A+C)}{C} \leq_{(T+C)-e} \frac{M}{C}$. Let $\frac{N}{C} \leq \frac{M}{C}$ such that $\frac{(A+C)}{C} \cap \frac{N}{C}=\frac{(T+C)}{C}$.Since $\frac{(A+C)}{C} \cap \frac{N}{C}=\frac{(A+C) \cap N}{C}=\frac{(A \cap N)+C}{C}$, then $(A \cap N)+C \leq T+C$, and hence $A \cap N \leq T+C$. But $A \leq(T+C)-\mathrm{M}$, therefore $\mathrm{N} \leq T+C$ and hence $\frac{\mathrm{N}}{\mathrm{C}} \leq \frac{(T+C)}{C}$.
