Published 3 times per year
Editor: Prof.dr. **Vincentas Lamanuskas**, Siauliai University, Lithuania
Publisher: Scientific Methodical Center „Scientia Educologica“ /Lithuania/, The associated member of Lithuanian Scientific Society

Congratulations to all of you! You have started new practical research journal in natural science domain of modern education. It seems to become an event not only for Lithuania's teachers, but also for your colleagues in many neighbor countries – your journal marks new stage of regional cooperation between active school teachers and those working in teacher education at universities.

Following methodology of systemic approach **“Natural Science Education” is going to join** development of modern educational content and technologies, pre-service and in-service teacher education, real needs of life and corresponding educational standards, and what is the most remarkable – **theory and practice with special accent on practical testing and implementation of modern theoretical proposals in real school practice.** It may become experimental educational school laboratory journal, where main persons are theoretically clever and practically active teachers working on their master degree thesis or experienced practitioners who value their life-long findings and report them to coming new generation of educationalists. This all together will help us to keep and develop high value natural science education standards both in theory and practice.

It is one of our main tasks for nearest future to resist expansion of unscientific world outlook and behavior, as well as **to develop scientific understanding of things and processes in our modern world.** Sciences are developed by people for people along with the need to take special care of many artificial phenomena in this world today because of tremendous progress of sciences and technologies... We need to concentrate our best natural science education resources in our region to keep definite order in our living material medium At the same time we need success in our schools when providing our pupils with appropriate natural science and technique education. **“Natural Science Education” will help us to solve these problems.**

Good luck to all of us and let us try to keep in definite order and at definite level this very important for real practice journal!

Sincerely yours,

Andris Broks
